Exostoses of External Auditory Meatus (Arthur Miller)	201
Forceps Hinton for Ballur Valgus Operation (I S Smillie)	971
Fractures of Malar Bone Depressed Treatment of (A B K Watkin)	927
Gas analysis Apparatus for Use with Oxygen Tents a Simple (Hugh Gainsborough and J Addyman Gardner)	813
Gastroscope a Flexible	77
Heart Failure Early Diagnosis and Treatment of (William Evans)	1145
Hermaphroditism Unusual Case of (Harold Chapple)	803
Hernia Injection Treatment of (Maurice Lee)	969
Hernia Strangulated Director for (Leonard Lee)	125
Hernia Ventral Midline (A Wood Power)	999
Hormones Male Chemistry and Assay of (R K Callow and A S Parkes)	457
Hunter William	198
Liverpool Medical Institution	1208
Lymphatic System Clinical Aspects of (H A Harris)	185
Needle Holder New Pattern (G I Preston)	1119
Nociffensor System of Nerves and its Reactions (Sir Thomas Lewis)	491
Oestrogenic Compounds Chemistry of (E C Dodds)	398
Ophthalmoscope a Polarizing (J D M Cardell)	701
Oral Drops in General Anaesthesia (A I H Baker)	40
Oxygen Administrative Inexpensive Flow Meter and Humidifier for (F I Poulton)	1113
Oxygen Tent New Open top (Hugh Gainsborough J Addyman Gardner and Ruth Murray)	812
Pleurisy, Obliterative Value of Oleothorax in (E C Chandler)	66
Proctoscope Clifton's Modified	1317
Prostate Transurethral Resection of (Kenneth M Walker)	901
Radon seed Introducer a New (F I Cleminson)	125
Radon Therapy Internal (E D Howitt I C Pillman Williams and S Russ)	209
Retractor Knee (H Jackson Burrows)	273
Saline Infusion Continuous Intravenous (Hamilton Bailey Wilfred I B Stinker and Kenneth D Keele)	571
Saline Intravenous Interceptor and Regulator for (Hamilton Bailey)	1259
Scissors Ophthalmic Trephine (J Edward Martin)	223
Sedimentometer Multiple Tube (J W Shackle and C I Estrange Orme)	921
Semple Lieut Colonel Sir David	147
Sigmoidoscope Operating (A Dreifus)	1259
Smith Sir Grafton Elliot	99
Smith Petersen Nail Modification of (C I Kindersley)	1119
Splint Fracture Universal (K H Tridle)	30
Sprigge Sir Samuel Squire	1346
Stretcher Metal	863
Swab Counting Board	173
Syringe for Splanchnic Anaesthesia (Harold Upcott)	614
Tendon Flexor Accidental Avulsion of (Phillip Simon)	1140
Tonsil Snare New (Geoffrey H Bateman)	1073
Trichomonas Vaginitis Treated by Silver Nitrate (W Neville Maxwell)	1115
Trocar and Cannula Intravenous	173

INDEX TO THE EPITOME FOR VOLUME I. 1937

Readers in search of a particular subject will find it useful to bear in mind that the references are in several cases distributed under two or more separate but nearly synonymous headings—such for instance as Brain and Cerebral Heart and Cardiac, Liver and Hepatic Renal and Kidney Cancer and Carcinoma Epithelioma Malignant Disease New Growth Sarcoma etc Child and Infant Bronchocele Goitre and Thyroid Diabetes Glycosuria and Sugar Eye Ophthalmia and Vision etc

The figures in this Index refer to the Number of the Paragraph NOT the Page

A

ABBOTT M A Vitamin C diuresis 94
Abortion habitual diet in 13
ABRAHAM E G Myoma and pregnancy 1
Abscess, brain 66 125—Histology of 1
Abscess, cerebral treatment of 264
Abscess, perinephritic diagnosis of 77
Abscess, peritonsillar 497
Accidents, motor facial injuries in 344
Acetanilide poisoning 359
Acetylcholine In anxiety states 26—In ocular affections 150
Acholurie jaundice *See* Jaundice
Acid base balance in infants 472
Acne juvenile of 453
Addison parathyroid and renal insufficiency 75
ADLER, A Clastro-intestinal affection and haemopoiesis 178
[illegible] of alcohol 140
[illegible] 4
Adrenal operation for Pott's disease 4
ADLER D Adrenal insufficiency 417
ALEXANDER H Fate of the young diabetic 44
Alcohol concentration in the blood 71
Alcohol intraspinal injections of 406
Alcoholism 92 93
Alimentary poisoning autogenous 63
ALLEN D G Test for anti-ketonia 328
Allergic diseases hormone in 165
Allergic tendencies in rheumatism 14
Allergy in rheumatism 76
Alopecia areata 205
AMANN L Jejunal absorption of water 200
Amidopyrin in rheumatic polyarthritis 180
Anaemia in pulmonary tuberculosis 19
Anaemia acute atypic 210
Anaemia thalassic 511

[illegible] 45
Anaesthesia avipan 105 399
Anaesthesia local therapeutic 174
Anaesthesia paravertebral dangers of 214
Anaesthesia peridural 24
Anaesthesia spinal 104
Anaesthesia spinal collapse during 389
Anaesthesia spinal complications and sequelae of 240
Anaesthesia spinal ephedrine in 387
Anaesthesia vinyl ether (vinesthene) 106 389
ANDREEW I Serum treatment of anthrax 464
Aneurysm cirsoid of retina 475
Aneurysm pulmonary 489
Angina pectoris trophanthin in 305
Anjoma of kidney 61
Anjoma racemosum capitis 107
Anjoneurotic facial changes after trauma 237
Anschelkonia a test for 325
Anthrax serum treatment of 464
Antigens dissociated from vaccinia elementary bodies 70
Anti-streptococcal sera specific improved 386
Anxiety states acetylcholine in 26
Apnoea with cyanosis in the newborn 200
Apoplexy utero placental 267
APPELBAUM E Chronic meningococcus septicaemia 192
Appendicitis acute 226
Appendicitis acute white blood cells in 176
Appendicitis mortality from 59
Appendicitis in pregnancy 109
Aspirin 491
Arsenical disinfection of diphtheria carriers 8
Arteriography dangers of 366—Therapeutic value of 51
Arteriosclerosis early diagnosis of 18
Arthritis differential diagnosis of 2
Arthritis gonococcal in the newborn 144
ARTUS CHRISTIANI C Myositis ossificans 26
ASAI T Infections impetigo 30
Aschheim Zondek reaction limitations of 51
ASCOLI M Adrenaline in malaria 325
Asthma bronchial insulin shock in 258
ASTRACHAN Morris Jaundice in children 429
Atelectasis upper lobe in children 41
ATTLEE M Labyrinthin diturbances in cerebellar tumours 410
Austin Flint murmur 356
Avitaminosis cardiovascular changes in 421

B

BACANU C Tuberculous bacilluria 115
BACHMANN H Follicular hormones and the resistant uterus 319
Bacilluria tuberculous 11 15
Bacillus Calmette Guérin vaccination 1—In children 10
Bacillus coli infections
Bacillus coli [illegible] immunity to 41
Bacteriaemia after tonsillectomy 444
Bacteriaemia [illegible] 1
BAIF W Liver extract in pernicious anaemia
BAIF M Vitamin deficiencies in pharyngitis 49
BAKER, Benjamin M Parathyroid adenoma and [illegible] of lupus 4
BARKAN H Prevention of ocular complications in trypanosomiasis therapy 208
BARTH K Radiosensitivity of rectum 30
Bartonella gonorrhoeal 14
BASTAI C Organic heart disease 249
Batistine operation 30
BATTRO A Ventricular synchronism 308
BAUCKE H H Alopecia areata 205
BEACH J W Vinyl ether anaesthesia 106
BEARD J W Intabit papilloma virus 52
BEATTY S R Serial radiographs of the chest 30
BEDELL A J Choroid remission 44
BEEK I Infectivity of old tuberculosis 484
BEEK A Permanent cardiac damage following diphtheria 103
BEGOUIN M I Pseudo uterine fibromata 125
Bejel bismuth in 6
BENARI M Amidopyrine in rheumatic polyarthritis 180
Beri beri and hyperemesis gravidarum 65
BERING I Cerebro-spinal syphilis 16
Berlin Influenza in 212
BERNSTEIN Ovarian tumours 225
BIRTH C H Idiopathic streptococcal septicaemia 45
Bile duct common obstruction of 405
Bile injection liver changes following 112
BILLET H Albee operation in children 45
Biopsy in bone tumours 420
BIRCHER W Ozone treatment of cystitis 7—In arteritis obliterans 274
BIRK F Strophanthin in angina pectoris 305
Bismuth in bejel 6
BJORKMAN S Bronchial catheterization and broncho pyometra 490
BLANC E Cirsoid aneurysm of retina 475
BLANC G Inoculation against typhus 123
BLANCO M I Kapok as dressing 55
Bleeding fatal 355
Bleeding post menopausal from a theca cell tumour 266
BLEGVAD N Rh Early laryngeal tuberculosis 340
BLIS L A Activation of prontosil 201
BLOMQUIST H E Evipan anaesthesia 105
Blood alcohol concentration in 71
Blood cell red diameters of 419
Blood [illegible] 176
Blood [illegible]
Blood [illegible]

[illegible] riture on 416
Blood sedimentation rate in elderly men 15
Blood sedimentation rate in scarlet fever 131
[illegible] culosis 376
[illegible] ral paralysis 94—In brain disease 409
Blood transfusion in pulmonary tuberculosis 346
Blood transfusions in scarlet fever 139
BLOUNT W P Tibia vara 302
BLUM K Agranulocytic anaemia 210
BODY O B [illegible] 134
BOEMINGHAUS
BOCAS J B
BOLFAS V
BÓKAY Z S Haemorrhagic nephritis 24
BOMPIANI G Progressive muscular dystrophy 113
Bon [illegible]
[illegible]
[illegible]
[

Cardiac arrest, permanent, following diphtheria 173
Cardiac hypertrophy in lung tumour 111
Cardiac pain 111
Cardiac Surgery of the Heart
Cardiovascular changes [illegible] 421
Cardiovascular disease, CO2 bath in 432
Cardiovascular hypertonia 514
Cardiovascular syphilis 514
CARR, M. Juvenile acne 426
CARRARA, N. Myxoedema and tuberculosis 141
CARTER, F. Diathermy in hypertrichosis 311
Cataract 443
CATTANEO, D. Eye changes in congenital syphilis 181
Cerebral toxicosis produced by [illegible]
Cerebral tumours. See Tumours
Cerebrospinal fluid in active syphilis 504
Cerebrospinal fluid in epilepsy 261
Cerebrospinal fluid sugar in meningitis 180
Cerebrospinal syphilis. See Syphilis
Cervical rib, colectomy for [illegible]
CHANG, H. J. Irradiation prostatic hypertrophy 194
CHAI, C. Y. Benign prostatic hypertrophy 194
CHAVANY, J. A. Hemiplegia caused by cerebral tumours 486
CHEKHET, V. Blood transfusion in scarlet fever 139
Chemotherapy in experimental bacillary dysentery 470
Chest, serial radiographs of the 267
CHIASCONE, I. M. Xanthoproteic acid 428
CHIAVATT, O. Exophthalmic goitre 140
CHINACHIA, A. Acute poliomyelitis of spine 382
Cholecystectomy, glyceryl trinitrate after 159
Cholecystography 518—Carbohydrate meal in 219
Cholecystotomy 424
Cholesterol in fractures 44
Chorion epithelioma 69
Chorion epithelioma, internal haemorrhage from 188
Chorion epithelioma and hydatidiform mole 193
Chorioderemia 471
CHRISTENSEN, B. Malignant tumours of the testicle [illegible]
CHRISTIE, A. C. Primary cancer of the lung 269
CHU LOK, I. Cultivation of typhus virus 206
CIDDIO, D. Traumatic nephritis 38
Circulatory complications in diphtheria, 118
Circulatory disturbances in thyroid disorder 232
Circoid aneurysm of retina 475
CLAMANN, M. Myalgia and infection 340
Claudication, intermittent 60
CLAUSEN, J. Dangers of salt free diet 397
Climate, sea. Indications for a 148
Clostridium tetani, antigenic types of 317
CO_2 baths in cardiovascular disease 492
COCHRANE, K. D. Cardiovascular syphilis 514
Cod liver oil ointment 472
COENEN, V. Kirschner's method for fractures of the femur 79
COHN, I. Clarence. Ingestion case of the breast 321
Colds, epidemic, sulphur dioxide in 196
Colitis, mucous 460
COLLINS, J. J. Testes and somatic carcinoma 93
Colporrhaphy and ventrofixation 491
Colpocopy 460
Coma, diabetic and hunger 241
Coma, diabetic, incidence and prevention of 116
See also Diabetic
COMINELLI-CAPUCHIA, J. Urethral stricture 108

WEEKLY PRICE 1/3, No 3965

Two Specialist Publications of the B.M.A.

★ *December number now ready*

★ ARCHIVES OF DISEASE IN CHILDHOOD

This specialist publication covering the whole field of paediatrics is issued bi-monthly and contains original articles of great importance to those who are interested in this particular branch of medical practice

"Archives of Disease in Childhood" is printed on high quality paper which lends itself admirably to the reproduction of photographs illustrating the articles, including radiographs

Yearly (Six Numbers), 25/- or 4/6 per copy

• The Journal of NEUROLOGY AND PSYCHOPATHOLOGY

The specialist in the neurological and allied branches of medical science will find in this quarterly publication articles contributed by the leaders of international thought, regarding all kinds of mental conditions *Abstracts from world* publications in the same field are also included

"The Journal of Neurology and Psychopathology" is printed in such a way as to enable the fullest benefit to be derived from the various illustrations in its pages

Subscription 30/- per annum or 8/6 per copy

● *October issue now current*

Obtainable from B.M.A. House, Tavistock Square, London, W.C.1

BRONCHOSPASM AND ASTHMA

A booklet surveying this subject, which includes diagrams and illustrations, has recently been published and has been sent to all members of the Medical Profession. You are invited to send for a copy should this have failed to reach you.

"THE LANCET" writes (28/4/34, p. 929):—

"We have received a pamphlet on 'Bronchospasm and Asthma,' written to bring before the medical profession the value of Felsol in the treatment of asthmatic subjects The powders can be prescribed by the medical man in accordance with the definite regime which he decides to adopt in the treatment of a case, the claim for felsol being that its administration relieves promptly the attack of asthma by its influence over bronchial spasm, so that only the most severe cases would require the injection of morphia"

MILTON PROPRIETARY

SATISFACTORY FINANCIAL SITUATION

The thirteenth ordinary general meeting of Milton Proprietary, Ltd, was held on December 17th, 1936, at Winchester House, E C

Mr H S Clough (the chairman) in moving the adoption of the report and accounts, said that the profits of the company for the year to 30th September, 1936, were £47,564, compared with £47,250 for the previous year The current assets, comprising stock, debtors and cash, amounted to £103,184 After deducting liabilities the net surplus of current assets was £73 723, a highly satisfactory financial position, showing that the company possessed adequate resources to maintain and develop its business The undistributed profits carried forward amounted to the substantial sum of £81,050

In referring to the products of the company, the Chairman stated that there was no other germicide or antiseptic on the market which was as efficacious as that produced and marketed under the brand of "Milton" In addition to its superiority as a powerful germicide it had many important advantages over similar products Its valuable characteristic of being non-poisonous and non-caustic gave it a multiplicity of uses, enabling its safe employment in every household The great value and advantages of Milton fluid were supported by investigations and reports made by eminent doctors and bacteriologists in this country and the United States

The company also produced an ointment which carried a high percentage of the Milton fluid and thus possessed the remarkable germicidal and healing properties of the fluid Another product was the Milton brand of dental cream which was produced after much research and was a high-class product inferior to none and superior to many, effectively performing the functions of a toothpaste

The resolutions approved, the directors' report and accounts and dividends were unanimously passed The retiring director was re-elected, Sir Martin Hall, Bt, was elected to the Board, and the auditors were reappointed

THE PRACTITIONER

Founded in  *the year 1868*

Edited by

SIR HUMPHRY ROLLESTON, BT GCVO KCB MD, FRCP.
and ALAN MONCRIEFF, MD, FRCP

NEW TYPE & NEW FORMAT

The Practitioner offers hearty congratulations to *The British Medical Journal* on the changes incorporated in this issue The modern developments in typography, making for better legibility and more artistic format, have the wholehearted support of the medical profession

With the new volume of *The Practitioner* beginning in January 1937, various improvements have been incorporated The changes are in accordance with modern developments The contents pages have been improved for the purpose of easy reference, the cover has been made more attractive, and the typography is altered throughout, the new type face chosen is Baskerville, a graceful and legible type

FORTHCOMING NUMBERS

Numbers planned for 1937 will include the following subjects

Gynecology
Uses and Abuses of Drugs and Preparations
Gastro-intestinal Disorders
Post-operative Care and Convalescence

The present collection of special articles on General Practice will be continued and later in the year there will be introduced a new series dealing with the practical aspects of modern nutrition as applied to 'Diet in Health and Disease'

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duplex" Apparatus

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS, SCIATICA, LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES, PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet higly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use, and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is **95/6**

MIL-SAN

the scientific contraceptive

MIL-SAN is a bland, non injurious, spermicidal jelly independent of variable physiological conditions of moisture or temperature Since there is nothing to melt, dissolve or foam MIL SAN is immediately effective

The formula of MIL-SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane, (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple, hygienic, and proof against carelessness Each application of 7 c c. is contained in a specially made strong glass tube sealed at one end with a cork, at the other by a hard wax plug In use the cork is removed, a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube which is thrown away proves the application and ensures the quantity There is nothing to fill, nothing to clean Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions

Literature setting out the ingredients and full particulars together with a box of specimen tubes for examination are sent on request to members of the medical profession

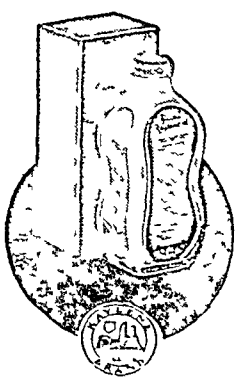
KAYLENE-OL

for INFLUENZA

℞ One dessertspoonful half an hour before each meal

TOXAEMIA REDUCED

CONVALESCENCE SHORTENED



SECONDARY INFECTION DIMINISHED

INDICATIONS

1 GASTRIC OR ABDOMINAL INFLUENZA.
Owing to the affinity of Kaylene ol for bacterial toxins, the patient is protected from such poisons produced in the alimentary tract

2 INFLUENZA characterised by inflammation in the nose and throat
Kaylene ol detoxicates the saliva and the discharges inevitably swallowed when the local lesion is in the nose or throat

3 POST-INFLUENZAL DEPRESSION
Kaylene ol prevents secondary intestinal toxaemia and thus shortens convalescence

Samples obtainable from the sole manufacturers —

KAYLENE LIMITED

LONDON, N W 2

IN INFANCY

To Prevent and Cure Rickets

'Halibol' is 100 times as concentrated as a good standard cod-liver oil in respect of vitamin D and of vitamin A It is a combination of a special and almost tasteless halibut liver oil with enough vitamin D to make the proportion between the two vitamins equal to that in cod liver oil

Halibol is standardized to a blue value (antimony trichloride test) of 1 800 and contains about 60 000 international units of Vitamin A per gramme while its vitamin D content is 10 000 international units (the equivalent of 0 25 milligramme of calciferol) per gramme

The glass tube of the special A & H tube stoppered vial delivers 3 drop to the minim and enables the last drop of oil to be removed from the bottom of the vial

Halibol is sold in tube stoppered vials of 5 c c at 2/ 10 c c at 3 6 and 30 c c at 10/ and a 5 oz size (for dispensing)

'.. I look on it as invaluable'

—M B , C M

In reporting on his experience with Radio-Malt, the medical officer of a well-known residential college states ' for years I have prescribed Radio-Malt, I look on it as invaluable '
It is a policy of prudence to administer Radio-Malt as a routine measure in schools, colleges, offices, factories and work-rooms, and, indeed, to persons of all ages who are compelled to congregate in crowded conveyances or whose work, of necessity, involves their close association with large numbers of other people, such administration of Radio-Malt builds up the body's resistance against any attacks of invading organisms and maintains throughout the winter months the vitality and robust health usually associated with summer time

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction

The following is typical of many reports received from physicians —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying In nearly all my cases the very distressing symptoms have disappeared after the third injection" ——————*M D*

Additional information regarding this Vaccine will gladly be supplied on request

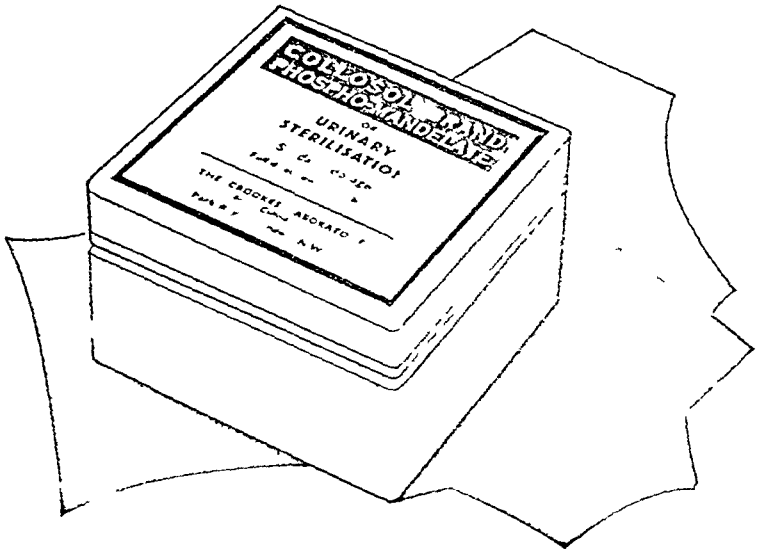
OVALTINE

FOR THE OLD AND FEEBLE

DURING old age, when the digestive powers and vitality are on the wane, the problem of satisfactory feeding often becomes acute A solution to this difficulty is found in "Ovaltine Its delightful flavour appeals to the jaded palate, its digestive action aids the enfeebled assimilation, while its high nutritive value stimulates the flagging metabolism It is a boon to the aged

In "Ovaltine the nutritive constituents of fresh milk, eggs and malt are transformed into crisp granules which dissolve readily in milk to form a delicious beverage A cup of "Ovaltine in the morning ensures energy for the day and a cup on retiring generally relieves the sleeplessness so common a symptom of old age, and gives digestive rest



"Ovaltine enriches the diet in certain important factors, notably calcium and vitamins A and B_2 which recent investigations have shown to promote longevity

Iron in Cocoa

The high mineral value of COCOA is being increasingly appreciated It is now known to be one of the most useful dietetic sources of iron—by far the richest among foodstuffs in common use

The table of comparisons set alongside will be of interest, therefore—and possibly of assistance—to general practitioners whose ordinary dietetic recommendations have so often to be directed towards preventing and combating specific mineral deficiencies It will be noted that whether 'total iron or 'ionisable iron' is to be taken as the probable measure of *available iron* (the point still seems in doubt) COCOA exceeds all the previously accepted sources except one

FOOD	TOTAL IRON mg 100 g	IONISABLE IRON mg 100 g
Apples	0 23	0 19
Potatoes	0 62	0 58
White bread	1 07	0 93
Digestive biscuits	1 57	1 45
Raw eggs	2 50	2 50
Brazils	2 70	1 65
Wholemeal bread	3 45	2 85
Raw beef	3 54	0 39
Raisins	3 80	3 68
Almonds	4 54	4 50
Raw ox liver	6 70	5 22
COCOA	14 20	13 20
Raw pig's liver	20 00	16 00

BRITISH MEDICAL JOURNAL

LONDON SATURDAY, JANUARY 2, 1937

ON SURGICAL DIAGNOSIS*

BY

W. H. OGILVIE, M.D., M.Ch.Oxon, F.R.C.S.

Surgeon and Teacher of Clinical Surgery, Guy's Hospital

Many of the higher examinations in medicine and surgery include a session devoted to the consideration of a single long case, which the student is instructed to discuss on paper under the following headings: history, symptoms, signs, diagnosis, differential diagnosis, prognosis, and treatment—seven divisions of which diagnosis is the central one. From whatever aspect we view the matter diagnosis occupies the dominant position—the keystone of the arch, the summit of the pass. On one side lies investigation, on the other treatment. For the patient diagnosis is the plateau to which he climbs from the valley of the shadow, plodding behind the guide following him round what may appear unnecessary bends in the rocky track, deceived from time to time by summits which are not the real one, on the plateau he rests while his guide consults map, studies the weather, and plans the route by which they shall go together down the slopes of treatment. Even more for the doctor is diagnosis a culminating point. It is preceded by the collection of a great number of facts whose mutual relevance may not be apparent, it involves a decision based on these facts upon the aetiology and pathological nature of a clinical problem, upon the decision follows action.

The Consultant's Part

Patients often say that doctors are interested in diagnosis only, and those concerned with medical education complain that too much time is spent in attachment of labels and in hair splitting distinctions between minor subdivisions of processes essentially alike. But while it should never be too much in evidence, diagnosis must remain of cardinal importance in medical training and practice for it presents the acme of professional skill. On the one hand may lie arid science on the other rule-of-thumb therapeutics, but in the central point diagnosis the doctor is called upon to exercise all his critical faculties, his practical experience, his wisdom born of years of consideration of similar problems, his power of clear decision. In diagnosis he is Homo Sapiens not Homo Quaerens or Homo Agens. The two sides of the watershed may call for knowledge, technical skill, and hard work, but wisdom alone will avail him on the summit.

In many highly organized foreign clinics the whole of the processes preliminary and subsequent to diagnosis are handed over to juniors or at any rate to executive workers. A case is placed provisionally in a general category by someone of intermediate status and then passed along a chain of -ologists and laboratory workers who pile up a dossier of encyclopaedic completeness. When diagnosed it is turned over to the remarkably efficient treatment machine of the institution and dosed or pruned upon lines that have been worked out in detail. But the analysis of the dossier, the interpretation and correlation of all the facts it contains and the establishment of the diagnosis is the work of chief or chiefs in consultation. Hence the *justification and the* need for that vanishing type of wise and learned man whom we call the consultant as distinct from the specialist. The specialist may thrive on knowledge and skill without wisdom, the consultant is useless. The specialist provides the detailed information. He is the permanent expert, the head of a civil service department while the consultant is the cabinet minister who guided and helped by the experts must decide policy.

Is there anything special about surgical diagnosis? Surgery broadly defined is a method of treatment by manual processes. Its territory is very largely on the sunny side of the watershed with smaller provinces on the summit and beyond. Surgery does not like medicine look upon diagnosis as the chief expression of its art nor like neurology as an end in itself but rather as a means to an end. A correct decision concerning the cause and pathology of a symptom complex is of great importance but only in so far as it points the way to correct treatment. And decision is more important than correctness because very often in surgery treatment must be immediate to be effective and that ultimate solvent of diagnostic difficulties the lapse of time is apt to lead to the final court of pathological exactitude—the post mortem room.

The surgeon who is considering a difficult and puzzling case confronts two separate questions. First: What is the probable nature and cause of this trouble? He must answer this for his own sake and that of his students and if he answers it definitely whether that answer be ultimately right or wrong both he and they will have learned something. Secondly: Which of the possible alternatives is the most urgent and the most dangerous even if it be not the most likely? His answer to this is of vital importance to the patient and upon it he must plan his line of action.

Sudden Abdominal Upsets

The need for immediate action *which in* surgery very often means operation is most apparent in *those* sudden abdominal upsets which we class provisionally as the acute abdomen. Here the problem before the surgeon is in its simplest form *the following*. *While the* exact diagnosis is by no means clear and for the present lies between A, B and C to what extent is the trouble likely to assume more serious form in the next twenty-four hours: is the case one that can be watched at home or as an out patient or should it be admitted to a hospital or a *nursing home*?

The commonest example of such a difficulty is the case of possible acute or subacute appendicitis one that when we first see it may very well be a true inflammatory lesion

* Address to the Eastbourne Medical Society.

in its early stages, or some upset in the mechanical category such as food poisoning or caecal distension due to constipation I am presuming that doubt still remains after a very careful analysis of the history and a thorough search for physical signs, which will always include a rectal examination I must apologize for alluding to such a hackneyed subject as the necessity for rectal examination in every case, but it is depressing to find how often this precaution is omitted and how often the omission has serious or even fatal consequences Inflammation in the pelvic appendix is not appendicitis as the textbooks describe it and the student learns it, there is no right iliac fossa pain, no abdominal tenderness, no muscle guarding It starts with the initial stages of colic and vomiting, symptoms which it shares with every insult to the viscera, from tinned salmon to strangulated hernia, it passes through the stages from inflammation to abscess, guarded from all discovery except by a finger in the rectum, and only betrayed by a general appearance of illness, and it only reappears in the abdomen as a large abscess or a general peritonitis

Decision to Operate

The case, then, presents no obvious physical signs If we make it a rule to wait till the diagnosis is clear we shall very often be too late for a clean operation without tubes, or a safe one with a mortality under 1/2 per cent If we admit every one we soon render our hospitals unmanageable and earn a reputation with our private patients for needless expense The decision will be guided by many things by the distance and nature of the patient's home, by the intelligence of his relatives, and by the time of day—in general, by the time that is likely to elapse before we can re-examine him or receive a reliable report on his condition But above all it will depend upon our personal assessment of the probable course of events in the next few hours—that is, upon our clinical instinct or sense built up from accumulated experience of similar cases, and independent to a large extent of the intellectual process of reasoning When we cannot decide, our only safe course is to place the patient in surroundings where his temperature and pulse can be recorded at regular intervals, where tests such as the diagnostic enema can be applied as they are needed, and where he is constantly under the observation of a trained assistant We take this step early rather than late, bearing in mind that should he get worse and require operation he will then be less able to stand transport, and that the risk of operation will be increased by an immediately precedent journey As experience accumulates the number of cases in which we defer judgement will decrease, but to "watch under hospital conditions" is always a safe decision

Another difficulty arises, particularly in children, at a later stage of similar cases, when it has become clear that there is an inflammatory lesion in the abdomen but not certain whether this is an infected appendix or possibly a group of tuberculous glands with secondary invasion by septic organisms or a pneumococcal peritonitis It is not my purpose here to discuss the differential diagnosis of these conditions, in the great majority they can be differentiated, and the last two are preferably treated by means other than operation But when doubt remains we have to balance the relative risk of exposing a group of inflamed glands or draining a pneumococcal peritonitis on the one hand or of leaving a gangrenous appendix or an early septic peritonitis on the other There is no need to state the answer, where this is the alternative we must operate

Recognition of Early Intestinal Obstruction

A problem of far greater difficulty in my opinion is the distinction between an early intestinal obstruction and other conditions giving rise to colic and vomiting, without localized pain or tenderness, abdominal rigidity, or any alteration in temperature or pulse rate I will presume that any additional evidence pointing to the likelihood of obstruction such as a tender swelling in a hernial orifice, the scar of a previous operation, or a history of tuberculous peritonitis is absent In such a case the chief things we have to exclude are intestinal colic due to swallowed irritants, drugs or foods which are infected or inimical to the particular patient, and colic in some other hollow tube in the abdominal cavity, such as the cystic duct or the ureter These non intestinal colics when encountered in their textbook form can be recognized by the first-year student, they may, however, give rise to central abdominal pain, visceral in type but quite unlocalized, and profuse and persistent vomiting, so that even an experienced clinician may fail to appreciate their origin

The unmistakable features of intestinal obstruction are that the vomiting persists and increases and that constipation is absolute, even to the passage of flatus In each case there is a loophole for error The vomiting of an obstruction is first reflex in origin, and later the result of mechanical backflow This overflow vomiting may not appear for some hours, or even days, if nothing is put into the canal above the obstruction, and if the element of infection (that is, strangulation) is absent or walled off Constipation is absolute only as regards material passing the site of the obstruction Any faecal matter, and it may be large in amount, which lies below the obstructed site is voided either spontaneously or in response to an enema, and even a second but smaller evacuation may follow

Here we are dealing with a condition which is uniformly fatal without operation and in which the operative mortality varies hardly at all with the surgeon's skill, but rather with the condition of the patient and of the intestine above the obstruction at the time of operation Such cases, therefore, should always be admitted where the pulse rate and appearance of the patient can be under constant observation, the vomit inspected, and enemas given and repeated as required Three rules have impressed themselves upon me as the result of long and sometimes unfortunate experience First, always give the patient plenty to drink—water or some harmless fluid such as lemonade or weak tea if he is going to vomit the sooner we know the better Secondly, never decide against obstruction on the result of the first enema, give a second two hours later, and if necessary a third If every single thing about the progress of the case—the cessation of vomiting and pain, the absence of distension, a feeling of improvement in the patient, and a dropping pulse rate—denies intestinal obstruction but no faecal matter or flatus is passed per rectum, insist upon operation and stake your reputation upon your decision Thirdly, if the pulse rate is steadily rising always advise laparotomy, though other features of the case suggest the safety of delay

This subject is so important that I would cite three personal cases, in one of which I was wrong and unsuccessful, in one wrong but successful and in the third one right I have not chosen them as a series to illustrate the increasing wisdom brought by experience, for they came to me in the reverse order I saw the first case, which is the least creditable to me, a year ago, and the third fifteen years ago

Case I

I was asked to see a lady of 65 years who had been vomiting almost continuously for eight days During the whole of this period she had no abdominal pain no tenderness and no distension Her bowels were opened the first day of the attack but she had passed nothing since in spite of repeated enemas She was seen in consultation on the fifth day of the attack by a physician who was unable to find any abnormal physical sign in her abdomen but discovered that she had a blood urea of 250 mg per 100 c.cm During the whole of the sixth day she did not vomit at all and a tube passed into her stomach showed it to be empty On the seventh day she started to vomit again and her blood urea was now 220 mg per 100 c.cm I saw her the next day

Though the physician who called me one of the wisest men in medicine to day was in doubt about the diagnosis I was prepared with the history of persistent vomiting and negative enemas to find a case of intestinal obstruction When however I saw the lady who had vomited all these days looking well and feeling free from distress when I could find no trace of distension or muscle guarding or of tenderness on abdominal or rectal examination when I found the pulse and temperature normal and the vomited material quite inoffensive and when I remembered that during this period she had ceased entirely to vomit for twenty four hours my conviction was shaken I suggested that the vomiting might be either toxic in origin or due to a nearly complete pyloric stenosis and that in any case no operation should be considered till the blood urea had been brought to a lower figure I therefore instituted a continuous drip saline infusion into a vein in the leg Two days later I was forced to operate by a rising pulse I found a large gall stone impacted in the ileum two inches above its lower end and causing gangrene of the gut throughout its circumference I removed the stone resected the gangrenous portion of intestine and drained the upper loop The patient died three days later

I quote this case to illustrate the dangers of too much erudition of too little common sense The astonishingly high blood urea was the Lorelei of science singing the same chant as a series of surgical uraemias following pyloric stenosis which it had been my lot to encounter and treat successfully during the past year and lulling my surgical conscience with dreams of toxic vomiting A surgeon who can possibly allow a patient who has passed no faeces or flatus for several days in spite of repeated enemas to remain unoperated upon deserves a jolt of this nature to put him back on his true course

Case II

I reported my second case in the *Lancet* in 1921 A young man of 23 years was admitted to Guy's with a typical history of acute intestinal obstruction of three days duration The illness started with a sudden agonizing pain following three days of vague abdominal discomfort From this time onwards he had been in continual but not severe pain He had vomited such fluids as he had taken and had passed nothing per rectum Inquiry showed that he had vomited after food only and that the vomit had never been offensive

He looked well and comfortable with a clear complexion and a clean moist tongue His temperature was 100 his pulse 88 The abdomen was slightly full but moved well and there were no distended coils or visible peristalsis vague tenderness was found over a wide area to the left of the umbilicus On rectal examination masses of scybala were felt but there was no tenderness whatsoever and no ballooning He was given an enema and passed a large formed motion with flatus The pain was relieved and he went to sleep Next morning he awoke feeling very well and his pulse was now 68 and his temperature 98·4 He had no pain and only slight tenderness He remained like this for the next two days taking fluids without vomiting with a normal temperature and a pulse under 80 His abdomen was however more distended and though he felt comfortable he did not look so well Operation was therefore advised

I found moderately distended coils of small intestine and a little free blood stained fluid in the abdomen On passing my hand downwards I felt a band snap at the pelvic brim and came upon a mass in the pelvis which I brought into the wound It consisted of several coils of intestine matted together and surrounding a loop of lower ileum about five inches long which was gangrenous and greenish yellow in colour I resected twelve inches of bowel and performed a lateral anastomosis Recovery was uneventful and the patient was discharged well a month later

I would quote what I wrote as a surgical registrar

In this case one had to decide whether to trust one's eyes or one's ears to explore the abdomen on the history alone in face of the clinical findings or to trust the latter and mistrust the history I wrongly chose the latter course Three things *influenced me in this decision* first that I did not know the patient and had no confirmation of his story from a medical man secondly that the passage of flatus as well as faeces is very unusual in any obstruction other than that of Richter's hernia thirdly that the man was a *plumber and since he* had very good teeth he might be suffering from lead colic without showing the characteristic blue line on the gums

To this comment I would add to day that where the history is in any way suggestive of intestinal obstruction the negative evidence of one enema alone should not be trusted a second should always be given

Case III

The third case was an old lady of 80 years who was admitted to Guy's one afternoon with a history of colicky pain referred to the umbilicus and vomiting both of which had started during the morning Questioned she thought that an orange she had eaten the previous night had disagreed with her Her tongue was clean her abdomen not distended and not tender her pulse 72 her appearance that of a feeble individual and a poor operative risk but in no way toxic She vomited some bile stained but odourless fluid An enema produced a large constipated motion She was given tea and put on an hourly pulse chart She continued to vomit still inoffensive material A second enema four hours later was returned with a fair amount of faecal material At 10 p.m her appearance and that of her abdomen was unchanged but she was still vomiting and her pulse had risen to 90 Operation was therefore advised A large mass was felt in the lumen of the lower ileum squeezed up into healthy bowel and removed It proved to be half of a small orange swallowed unchewed The hemispherical shape of the obstructing body had allowed intestinal material to pass along its flat side

Intestinal obstruction in a baby usually means intussusception The great majority of these cases are most fortunately unmistakable Difficulty arises when the baby looks too ill for the length of the history when the characteristic intermissions appear to be absent and when no lump can be felt Here the rule that we must act upon the most dangerous of possible alternatives impels us to admit every case immediately The possible causes of a similar symptom complex are Henoch's purpura and acute intestinal toxaemia With regard to the first a submucous haemorrhage unaccompanied by a subcutaneous one must be so rare that we have no right to let its possibility influence our judgement at all The second is unlikely without diarrhoea and should be considered only if the rectal contents are faecal or tinged with bile When any doubt remains it is wise to take the baby to the theatre and there prepared immediately to operate to palpate the abdomen under anaesthesia

But the acute abdomen is not the only example of *the doubtful* abdomen there are many less urgent where *the surgeon* after considering all available evidence is called upon to decide a line of action rather than to attach a label A line of action is indeed necessary before even a label can be provided for the doubtful abdomen, the type of case in which after considering carefully the

history and the facts we have obtained by our clinical examination we are still uncertain whether there is organic disease, and, if so, whether it is a single lesion or a combination of several

The Doubtful Abdomen

A not uncommon illustration of such a difficulty is when we suspect gall-stones, duodenal ulcer, and a chronic appendix, one, two, or all three of them A complete investigation is a lengthy, and for a private patient an expensive business What we really need to know is whether operation will be required, if so, all subsidiary doubts can be left to be settled by this one certain method We therefore concentrate upon the gall-bladder, for, apart from the small body of qualified confidence men who "dissolve" or "expel" gall-stones, there is a general agreement among doctors that the treatment of stones, once they are giving serious trouble, is operative Should we start with a barium meal and find an ulcer we must still investigate the gall-bladder and appendix I say this because I believe, as I am sure do most of you, that the operative treatment of duodenal ulcer, as apart from that of its rarer complications, is as unsound, and should be as dead as, the medical treatment of rebellious gall-stones If we find gall-stones we operate, look at the stomach and duodenum, and remove the appendix, healthy or unhealthy

But in the uncertain chronic abdomen, as in the acute one, it is the appendix that comes first to mind I do not wish to be led astray from my main thesis into an oration on the chronic appendix, a disease responsible more than any other for lazy diagnosis, slipshod pathology, and commercial surgery The only advice I can give my registrars is never to admit its existence to students or themselves until they are 35, and never to take a fee for removing one until they are 40 Being well on the safe side of this line myself I am certain that there is such an entity I am not considering any case that might be classed as intermittent appendicitis Where there has been a reasonably clear history of an acute attack in the past, where the attacks are definitely intermittent, lasting about a week and separated by intervals of normal health, where the symptoms are gastric, and appendicular tenderness is first found by the physician and not by the patient, the diagnosis is reasonably clear But there is also a condition in which attacks of mild pain, limited to the right iliac fossa, and constantly recurring, without pyrexia or vomiting, are due to the appendix Further, the appendix may, on removal, be indistinguishable from normal, and the diagnosis is confirmed by the therapeutic test alone After removal of such a harmless-looking tube the patients not only lose their symptoms, but they enter a new phase of health, which shows them for the first time that they were not well before It is a considerable experience of cases of this type occurring among colleagues and personal medical friends, where they and I have discussed all possibilities and decided upon appendicectomy with hope rather than conviction, where the improvement has astounded me and delighted them, that has forced my unwilling acceptance of this dreadfully vague lesion For I still cannot claim any certain method of distinguishing the true from the false chronic appendix

Let us presume that we have very carefully excluded all those conditions failure to recognize which has brought the operation of limited laparotomy into disrepute partial obstruction of the right ureter from stone or otherwise, inflammatory changes in the right tube or ovary, caecal distension or prolapse and that the radiologist's examination of the appendix itself has disclosed no abnormality The patient still complains of pain and we still find tenderness at or below McBurney's point in an area no larger than a penny Two questions will pass through our minds "What harm will I do if this is a chronic appendix, and I leave it alone?" and "What harm will I do if I remove a perfectly normal appendix?" To the first we must answer "No great harm" An appendix of this sort is very unlikely to flare up in an acute attack On the other hand the symptoms will certainly persist, operation will be required, and until it is done ill health will continue To the second we must answer "No harm, if I operate through a planned and limited incision, unless the patient is a potential neurotic, if on the other hand I advise laparotomy, I undertake an operation with a slight but definite mortality, and other possible lesser sequelae in the way of abdominal insufficiency and adhesions" To sum up in such a case we must take the greatest care to exclude the potential neurotic, she will certainly have her appendix removed, but, however rich she may be, we should let someone else do it and be plagued by her ever afterwards With a sensible patient we advise a limited appendicectomy, but need not urge it unless he is going out of reach of civilization Laparotomy is not to be encouraged

Indications for Laparotomy

This brings me to what is one of the most important matters of policy that a surgeon has to decide What are the indications, if any, for laparotomy? He will have to consider a purely exploratory operation for a number of different lesions, and first in these doubtful appendix cases I have just advised you against it In the first edition of *Recent Advances in Surgery* I stated, with the dogmatism that is rightly expected from a man ten years younger than I am to-day "Chronic appendicitis is only diagnosed after careful investigation and the weighing of every alternative possibility, and it is only treated by laparotomy" But what will a laparotomy tell us in the type of case we are discussing, one we have investigated thoroughly and pondered at leisure? Through a reasonable incision we can see the organs in the right lower quadrant of the abdomen, all the small intestine and its mesentery, and the pelvic organs We can feel the whole abdominal cavity, and by this means can immediately recognize stones in the gall-bladder or kidneys, cancer of the stomach or large intestine, enlargement of the liver or spleen, and gastric or duodenal ulcer But all these lesions are unlikely in the case we are discussing, and should have been excluded by our preliminary investigation We cannot recognize non-destructive lesions by touch alone—cholecystitis, gastritis, duodenitis, colitis—nor should we attack them surgically if we could A really large opening will allow us to see everything, but, again referring to this particular class of case, it is very unlikely that by inspection we can establish something that our biochemical and radiological colleagues have been unable to disclose I am now firmly convinced that the surgical treatment for a chronic appendix is operation through a very limited gridiron incision, which will allow removal of the appendix and one-finger palpation of the tubes and ovaries and no more Such an operation has no mortality and no sequelae, and involves hardly any loss of time, it is justified, therefore, even as a means of "diagnosis by elimination" Though limited, it will tell us all that a wide laparotomy is likely to do, without its risks

In the surgery of gastric or duodenal ulcer laparotomy has no place If the diagnosis is not clear after a barium meal and test meal, then those complications which alone can justify surgery have not yet arisen Organic stenosis,

repeated severe haemorrhage, extension to a size that prohibits permanent healing early malignant change can all be established with greater certainty by observation radiography, and functional tests than by inspection and palpation Operation is undertaken for treatment and not for diagnosis Still less is the surgeon justified in advising laparotomy for symptoms suggesting gall bladder trouble for inspection and palpation can very rarely demonstrate disease which clinical investigation and x ray have failed to disclose Lipoid deposits on the mucous membrane and obscure neuro muscular derangements of the mechanism of emptying may give rise to recurring attacks of severe pain yet leave the shape density and concentrating power of the gall bladder, those characteristics which can be examined radiologically unchanged and its appearance and texture apparently normal We must decide upon the history and results of our investigation which will often include a prolonged period of observation and a therapeutic trial of medical drainage whether the symptoms arise in the gall bladder If we have so decided we operate to remove the gall bladder and no apparent normality of its surface or texture can affect that decision

Laparotomy and Carcinoma

When the possibility of carcinoma lies among the alternatives we are turning over in our minds the question 'Am I likely to do more harm by delay or by laparotomy?' assumes a very different complexion We are often told that the most sinister fact about cancer is its complete silence during the early stages giving the victim no indication that anything is amiss till the disease is far advanced We are frequently assured that neoplasms, at any rate when they affect the stomach and colon can be recognized by clinical biochemical and radiological investigation provided the patient has symptoms and presents himself for examination Yet it is a painful fact that the ordinary working surgeon repeatedly meets cases which have been under the care of most eminent and conscientious physicians for months as suspects who have been repeatedly investigated and repeatedly x rayed with negative results who finally are somewhat grudgingly advised a laparotomy, which discloses a growth about two months too late for resection Such at any rate, has been my experience eight times this year It is an aphorism in yacht racing that the man who does not cross the line before the gun one race in seven is never going to get a good start In cancer surgery the man who does not do one unnecessary laparotomy in seven is going to lose many lives through timidity When we find a man over 50 who has hitherto been healthy starting to lose weight and strength progressively even though he has no pain indigestion or constipation even though every test is negative, we must still feel that carcinoma is only too likely I would always accept the positive warning of a penny weighing machine in preference to the negative assurance of a ten guinea expert If the weighing machine persists in this opinion after six weeks during which the patient has been relieved of work and worries kept strictly at rest, and carefully dieted, we must advise laparotomy and urge it with all the persuasive powers at our command The evidence of eye and hand is the only final court of appeal A sensible patient will readily fall in with this advice when it is put to him and if the result is negative he will be so delighted to receive a clean bill of health that he will think nothing of his suffering or even of our fee

Exploratory laparotomy, then, is a course which we will never advise lightheartedly, and only when we are certain that it is a lesser evil than delay To day the mortality of such an operation has been practically abolished thanks to improvements in anaesthesia and preoperative and post operative treatment, and adhesions to the scar have been rendered less likely by methods of suture which leave no raw surface on its abdominal aspect Even so the risk cannot be less than one in five hundred or the incidence of adhesions less than one in fifty

I have thus far chosen the illustrations to my thesis the lamentably simple one that in surgery decision is often the better part of diagnosis from the abdomen This has been almost inevitable because so many of the structures in this dark cavity are liable to catastrophes that progress with startling rapidity from their silent onset to their fatal termination because their topography is not constant, as in the rest of the body, but to a certain extent fluid, because their troubles are only vaguely recognized by their owner, and then referred by him to their embryological rather than their present site and because they are entirely hidden from our eyes and very effectively screened from our hands But exactly the same need for precocious decision is constantly arising in other parts of the body

Subacute Arthritis of Childhood

A clinical puzzle that we encounter all too frequently is the subacute arthritis of childhood the joint that may possibly be tuberculous The onset of tuberculous arthritis is as you all know remarkably quiet Pain beloved of the textbook is rarely a prominent and never an early symptom it appears only when destruction of the joint is already far advanced So symptomless is the onset bringing nothing more obvious even to a solicitous parent than a disinclination to play that we rarely see an early case The children are brought to us with marked wasting limitation of movement and destruction of bone that is visible in the x ray picture and has often produced a mensurable deformity When the diagnosis of tuberculosis can be made with certainty the time for cure is long since past, the only tuberculous joints that are cured—that is restored to complete normality—are those in which the diagnosis is uncertain What then is to be our attitude? If on the one hand we watch every doubtful case till it is no longer doubtful we will make many unnecessary cripples if on the other hand we decide to regard every doubtful case as tuberculous we must enforce a minimum period of two years immobilization protection or restricted activity—a most drastic treatment for a case that is not tuberculous Let me give a definite example from my own recent experience

I was asked to see a little boy of 5 because he had been limping slightly for about six weeks I found a fair haired rosy cheeked youngster who looked the picture of health At first he would not limp but as he played about the room I noticed that he tended to spare the right leg as he pranced around I will not give the results of my examination in detail but will tell you that the first and most important of the methods at our disposal inspection gave me the only indication of abnormality that I was able to obtain I could see a little thickening of the tissues in the right knee joint apparent only in a blurring of the outline of the patella and patellar tendon when compared with the other side When I felt the knees I was unable to appreciate any difference to detect any fluid or synovial thickening The measurement of both thighs and calves was equal the movements of the hips knees and ankles the same An x ray photograph taken next day showed no abnormality no difference between the bones of the two limbs The child had had no previous ailments of any kind he lived in one of London's newest and healthiest suburbs and spent most of the day in a large garden he slept and ate well On the other hand one parent had a strong tuberculous history

The diagnosis in such a case would be no more than a matter of *amour propre* for the doctor did it not imply decisions upon treatment affecting in any case the next year or two of the child's life, and possibly his whole future Children at the age of 5 are very prone to a non-specific arthritis, whose origin and causative organism is unknown One of my colleagues held sufficiently strong views on the first question to class this group as "tonsil joints," while many would attribute them to a mild streptococcal infection To immobilize a tonsil joint for two years would be a calamity only exceeded by that of allowing a tuberculous one to run about till a definite bone focus had become apparent The one certain diagnostic test, arthrotomy and removal of a piece of synovial membrane for section, is fraught with far too many dangers should the condition be tuberculous to allow it to be considered

The only decision possible to us is that we must regard every chronic or subacute arthritis appearing in a child between the ages of 3 and 12 as tuberculous until we have proved the contrary, and we can prove this only by a period of diagnostic rest Complete immobilization, by splint or plaster-of-Paris, has no distinctive value, for it will cause any inflamed joint, tuberculous or otherwise, to settle down, and when it has settled we are in an even worse position, still doubtful whether we can risk activity with the chance of reactivating a tuberculous process, and with no physical signs to guide us or to support our cautious attitude before the parent Mere rest in bed, on the other hand, will clear up a "tonsil joint" in six to eight weeks, but will do no more than keep a tuberculous one stationary If at the end of this period we still find the joint swollen, with limited movements, we can proceed to a period of rigorous immobilization with the certain knowledge that it is necessary and the comforting reassurance that it is in time

Indefinite Mammary Trouble

Yet another instance where diagnosis is a matter of faith but decision of vital importance is provided by the indefinite troubles of the breast in women of over 40 Here, as in similar troubles in the abdomen of men a decade older, the first question to be faced and answered is that of possible malignancy But whereas in the abdomen we can, when doubt remains after prolonged consideration, decide to look and see, leaving things as before if cancer is excluded, in the breast we can only remove and see, and by this I mean remove the whole breast When a woman has passed the age of 40 she has passed the time when any local operation on the breast is safe I say this because one lesson which we can apply to our daily task appears to emerge from the large amount of pathological research which has been done within the last decade, that changes which occur in the female breast after the peak of the child-bearing period, be they degenerative or malignant, are prone to occur simultaneously in many parts of it, and any such change sufficiently advanced to be appreciated by our senses is not an isolated lesion but a sample of what the rest of the breast holds in a less obvious form These breasts often contain lumps which have no single physical sign suggesting cancer The commonest form for the lumps to take is that of irregular nodules of rubbery consistency scattered throughout the breast substance, linked up to each other by intervening strands and impalpable with the flat of the hand For these lumps I should prefer to retain the name of chronic mastitis till pathologists have ceased to differ among themselves about the aetiology and pathological nature of the different types and have agreed to hand out a classification which we may accept and teach our students Chronic mastitis does not call for surgery, or even for alarm, but merely for caution I do not suggest that any woman with such a breast can in fairness be advised to forget about it, she can be told not to worry about it, but requested in a reassuring way to come for an overhaul every few months Chronic mastitis is so common that its relation to cancer can never be assessed numerically, but there is no doubt that a breast in which the epithelial structures are pressed upon, their nutrition impaired, and their lymphatic drainage obstructed by an increase in the interstitial fibrous tissue will be more liable than a normal one to develop malignant changes Patients, however, rarely ask for advice about such a breast, but come because a single lump has recently attracted their attention is growing, or has become painful If such a lump has any single character of malignancy we must neglect all signs pointing the other way and treat it as cancer By my qualifying introduction, however, I am suggesting that it differs from all other lumps we may find in the breast only in being palpable with the flat of the hand, it is not hard, nor is the shape, contour, or mobility of the breast in any way different from that of its fellow Such a lump is almost certainly a cyst The patient wants us to remove it To agree will be easier for her and for ourselves, for it relieves her fears and establishes our position as men of decision You must all be familiar with the patter of the lump remover

> 'I feel certain, my dear Mrs Smith, that there is no need to worry in your case, but I know that your anxiety comes from a knowledge that many lumps in the breast of women of your age, harmless at first, later undergo changes of the most serious nature I would far rather see a patient sufficiently alive to these possibilities to be unnecessarily afraid than one who remains complacent till the chances of cure are long past But while I feel convinced that this lump of yours is innocent in nature you will realize that that is no more than my opinion, for what it is worth, and that the only final answer is that given by the microscope I should therefore strongly advise you to submit immediately to a small operation for its removal, an operation without risk, that can, if you wish it, be done under local anaesthesia In this way alone will it be possible to get an unequivocal verdict and to set your mind, as well as my own, at rest"

The summing-up is excellent, the judgement wretched The lump we feel is one of a countless host scattered throughout the breast, differing from the others only in being distended to a greater extent with fluid, but not therefore any more or less likely to show early malignant changes To remove it is neither treatment nor diagnosis, nor is it even decision It is akin to the policy of the president of a South American Republic who would seek to scotch a revolution by shooting the fattest of his opponents The lump is either precancerous or it is not precancerous If it is, the whole breast should be removed, if it is not, its excision is not only unnecessary but gives a false sense of security which will often cause the subsequent appearance of malignant change to be ignored till too late A similar problem is presented to us by discharge, serous or blood-stained, from the nipple Such a discharge may be due to chronic mastitis, to duct papilloma, or to duct carcinoma If there is a lump in the lobe drained by the discharging duct we cannot say that it is papillomatous or malignant till the signs of wider involvement appear, if there is no lump any diagnosis is no more than a guess But discharge from a duct means irritation in an epithelial-lined tube, irritation leads to proliferation, and proliferation in time assumes the characters of unrestrained growth Discharge from the nipple calls for decision rather than diagnosis, and that decision must be between further observation and excision of the whole breast and its fascia

Two Main Considerations

I realize that my views about the doubtful breast are drastic, but if they are right they must be accepted Two considerations may make their acceptance easier First, when we come to deal with the treatment of cancer we discuss various alternatives—radical surgery of different types, irradiation in one of its many forms or a combination of the two methods—in the attempt to find that plan which carries the greatest chance of cure But we know that in the long run our successes will seldom be more than 60 per cent, and we can never be certain that we shall succeed with any particular patient however localized the disease may appear to be With precancerous conditions on the other hand we can by a much more limited removal, guarantee success in 100 per cent carried to any number of decimals Returning to my simile of the revolution—and no comparison could better fit cancer where one group of cells combines to attack the corporate body, with the probability that both whole and part will be involved in the eventual ruin—we may compare the usual method employed to deal with such uprisings—to attack the insurgents after revolution has broken out with the much more scientific prophylactic method evolved in Russia that of exterminating (liquidating is the correct political euphemism) the whole social stratum in which discontent might arise before the first hint of trouble This method after all is the only safe one, it has meant the slaughter in cold blood of some three million innocent people but it has made Russia safe for communism

The second consideration is that the operation which is adequate to deal with a precancerous breast is limited sightly, and far less severe and dangerous than that which will be required when cancer has appeared It involves the removal of all breast tissue, of the pectoralis fascia in which the main lymphatic channels lie and preferably of the anterior axillary glands in addition but not of the muscles or of any more skin than is necessary to fashion flaps that will clothe the chest without redundancy when the breast has been removed It can be accomplished through a low curved incision placed horizontally and will leave a scar that is invisible, even in the best night clubs or on the beach at Juan les Pins We are however, treating the patient rather than the disease, and we may be forced to local removal of a lump if we realize that she will otherwise fly to some quack remedy But the ordinary sensible woman will accept the reasonableness of our advice and be content to report for examination at regular intervals content in the knowledge that we shall recommend more drastic measures only when they are necessary Should we see any danger sign, such as unilateral alteration in the shape of the breast, or of the orientation or level of the nipple, we must give this advice even though the lump itself remains unchanged

Conclusion

I have tried to suggest a point of view rather than to lay down rules as indeed it would be most unfitting for me to do To us our profession is more than a trade it is our life an expression of our humanity That humanity has three aspects—science, art religion we know we feel we believe But the third, which is perhaps the most important of all which underlies the others is least often acknowledged Many writers speak of the science and art of medicine but none since Sir Thomas Browne has written of the religion of medicine The three are necessary to a sane and balanced whole for just as science and religion without art produce the fanatic art and religion without science the mystic so science and art unleavened by faith produce the virtuoso the technical expert The faith of medicine is expressed in the Hippocratic oath "The course I adopt shall be for the benefit of my patients, according to my ability and judgement The welfare of the patient is the end we seek in surgical decision, which thus becomes the surgeon s religion a faith that must sometimes repudiate science and transcend diagnosis

CHRONIC MENINGITIS IN WEIL'S DISEASE

BY

FREDERICK MURGATROYD, M D, M R C P D T M

Lecturer in Tropical Medicine Liverpool School of Tropical Medicine Honorary Assistant Physician for Tropical Diseases Liverpool Royal Infirmary

This note describes a case of Weil s disease associated with chronic meningitis and is of interest not only because the first evidence of meningitis was observed four months from the beginning of the disease but also because leptospira were recovered from the cerebro spinal fluid six months and from the urine of the patient eight months after the onset of the illness The patient was a farm labourer aged 35 years and his illness is summarized in the following notes

History of Illness

The patient lived in Ireland until a year ago when he came to England to work on a farm near Lancaster his work does not appear to have exposed him in any particular way to the risk of a leptospiral infection but there were many rats about the farm Until December 1935 he had always enjoyed good health

He was admitted to a hospital in Lancaster on December 16th 1935 suffering from a febrile illness which had begun between one and two weeks previously He was jaundiced and *Leptospira icterohaemorrhagiae* were found in the urine Within a week of admission the temperature fell to normal but there was a further slight rise about the tenth and eleventh days after which the patient s condition improved and the jaundice gradually disappeared The attack was apparently typical Weil s disease but recovery was not complete and early in January there was a slight irregular fever He was given an intravenous injection of 0 1 gramme of sodium potassium bismuth tartrate on January 25th 27th and 31st but as this was followed by a severe fever with a temperature of 103 F on February 4th and later by an itching scaly eruption all over the face trunk and limbs no further injections were given The rash slowly disappeared but he had a moderately severe and irregular fever until the beginning of March His temperature then became normal and he improved sufficiently to be allowed out of bed although he still remained in hospital Towards the end of March the fever recurred and early in April just over four months after the date of his admission he began to suffer from severe headaches The headaches were at first relieved by simple remedies and later by lumbar puncture but finally such measures produced only slight and transient relief The patient s vision then began to fail and the temperature was persistently swinging each day between 99 and 101 F the headache became intense and the general condition was obviously becoming very serious The cerebro spinal fluid was examined on May 14th and was found to be under increased pressure and to contain an excess of cells the Lange curve was 0001221000 and the Kahn reaction negative

The cause of the meningitic reaction was not determined and as the patient s condition was steadily deteriorating he was transferred to the Liverpool Royal Infirmary, where he was first seen by me on May 20th

General Examination

He was lying curled up on his left side, with the bedclothes drawn over his head. There was no jaundice, but he was pale, with flushed cheeks, and extremely wasted and weak. Cerebration was slow.

Cardiovascular System.—Heart rhythm regular, 80 per minute, apex beat in fifth space within nipple line, heart sounds faint, with soft systolic bruit at all areas. Blood pressure 120/78 mm. of Hg. No evidence of haemorrhages into skin or mucous membranes, but the left fundus oculi showed generalized oedema of the retina, with haemorrhages near the disk, the right fundus was not seen (*vide infra*).

Respiratory System.—Respirations, 18 per minute, chest movements symmetrical, percussion normal, fremitus and resonance normal, breath sounds normal, and no adventitious sounds. There was a little cough, but the scanty sputum showed nothing of significance.

Alimentary System.—Some redness of the fauces, but otherwise nothing of moment.

Genito-urinary System.—Apparently normal, excepting for slight phimosis. Urine clear, acid, no albumin, no sugar, centrifuged deposit consisted of amorphous urates with very occasional leucocytes, no organisms seen in ordinary examination or by dark-ground illumination.

Central Nervous System.—Cerebration depressed, severe persistent headache, rigidity of neck. Generalized weakness, but no obvious objective motor or sensory disturbances, and no evidence of any cranial nerve lesion. (The vision was poor, but there was gross damage to the media of the right eye, and definite oedema of the left retina. The right pupil was fixed by adhesions, and therefore reacted poorly to light (*Vide infra*.) Knee-jerks feeble, but present and symmetrical, plantar reflexes flexor.

The liver was not apparently enlarged, but the spleen was palpable one and a half inches below the costal margin, and there were small palpable glands in the neck, axillae, and groins.

These findings suggested a generalized infection with meningitic involvement, and the following further examinations were therefore carried out.

Cerebro spinal Fluid.—Appearance very faintly opalescent, fibrinous clot on standing. Pressure 250 to 280 mm. of water. Protein moderate increase. Chlorides 613 mg. per 100 c.cm. Sugar normal. Non-protein nitrogen 15 mg. per 100 c.cm. Cells 173 per c.mm. (60 per cent. polymorphs 30 per cent. lymphocytes, and 10 per cent. large degenerated cells). Wassermann reaction negative in all dilutions. Cultures remained sterile at 37° C. for three days.

Blood.—Erythrocytes 2,400,000 per c.mm. Halometer reading 7·4μ. Haemoglobin 45 per cent. Colour index 0·9. Leucocytes 7,500 per c.mm. Films: erythrocytes normal excepting for slight basophilia and polychromasia. Leucocytes normal in appearance and relative proportions. No parasites seen. Van den Bergh reaction: direct negative, indirect less than 0·5 units. Non-protein nitrogen 40 mg. per 100 c.cm. Agglutination completely negative with *B. typhosus* O. and H, *B. paratyphosus* A. and B, and with *B. melitensis* and *B. abortus*. Cultures remained sterile at 37° C. for three days. Wassermann reaction negative.

Urine obtained by catheter remained sterile in culture at 37° C. for two days, and the faeces were chemically and bacteriologically normal.

The heart and lungs appeared normal on *x*-ray examination, and there was no *x*-ray evidence of any abnormality in the skull.

Mr. McKie Reid, the ophthalmic surgeon, examined the eyes, and reported: "Right eye: pupil irregularly bound down with exudates of an old iritis, organizing vitreous haemorrhage present; fundus details not seen. Left eye: pupil reacts normally; media clear, slight generalized juxtapapillary oedema of retina, striate haemorrhages near disk along superior temporal vein."

Diagnosis

When the results of the various examinations were obtained it was thought that the most probable diagnosis was that of tuberculous meningitis, although the duration of the meningitis and the high percentage of polymorphonuclear cells in the cerebro spinal fluid two months from the onset gave rise to doubts as to the correctness of this view. The possibility of the meningitic infection being due to *Leptospira icterohaemorrhagiae* was discussed, but without conviction, because although meningitis is a well known complication of the acute stage of Weil's disease so far as was known it had never been described as occurring so long after the onset of the disease, while, furthermore, the total duration of a leptospiral infection in man was considered to be very much shorter than the duration of this patient's illness. However, in view of the doubt about the diagnosis, and the failure to demonstrate any organisms in the cerebro-spinal fluid, a second lumbar puncture was performed on May 25th. The fluid obtained on this occasion was immediately centrifuged at high speed and a sample of the deposit carefully examined microscopically, both in the ordinary way and by dark ground illumination, but no organisms were seen.

The greater part of the deposit, suspended in a few cubic centimetres of the supernatant fluid, was then inoculated into two healthy guinea-pigs, which were isolated and carefully observed. On June 4th one of the guinea-pigs was obviously ill, and *L. icterohaemorrhagiae* were discovered in its blood. This animal died on the following day, and at post-mortem examination presented signs of Weil's disease, typical of a guinea pig inoculated directly from man.

The tissues were jaundiced, and showed small scattered haemorrhages. Macroscopically the liver was not grossly abnormal, but microscopically it presented areas of fatty degeneration and necrosis. Haemorrhages were found in the kidneys, and the urine was rich in leptospira. The adrenals were enormously enlarged and haemorrhagic. The spleen and lymphatic glands were slightly enlarged and the lungs showed irregular haemorrhagic areas. Leptospira were demonstrated in the organs by silver impregnation, and I am indebted to Dr. A. J. Walker for the preparation of these sections.

Before the death of this animal its blood was inoculated into further guinea-pigs and into medium consisting of five parts physiological saline and one part rabbit serum, and heated to 56° C. for thirty minutes. The strain has since been maintained by culture in this medium at 30° C., and for a time it was also maintained by passage through guinea-pigs. The guinea-pig of the sixth passage, however, became spontaneously cured, and further animals inoculated with this guinea-pig's blood, while it still showed leptospira, failed to become infected. The strain appeared, therefore, to be only moderately virulent for guinea-pigs and, in fact, the second of the two animals inoculated directly from the patient's cerebro spinal fluid showed no signs of infection during an observation period of more than six weeks.

Further Investigations

In view of the results obtained above, the patient's cerebro-spinal fluid, blood, and urine were further examined on June 6th. In no instance were leptospira found directly by the microscope, and animals and cultures inoculated from the cerebro-spinal fluid and blood remained negative over an observation period of several weeks. Two guinea-pigs however, inoculated with the deposit obtained by high-speed centrifugation of the patient's urine became infected and died of typical Weil's disease ten days later.

Samples of the patient's cerebro spinal fluid and blood serum were then sent to Major H. C. Brown and Dr.

J C Broom who very kindly examined the serological reaction of these fluids with various strains of leptospira possessed by them Their preliminary report stated that both the patient's serum and cerebro spinal fluid were completely negative by agglutination test with their following strains of leptospira Jackson, *canicola* dog IX, and by adhesion test with their strain 'Rachmat' A further supply of serum was sent to them together with subinoculated guinea pigs and cultures obtained from the animal infected directly from the patient's cerebro spinal fluid The results of their subsequent tests were as follows

Agglutination Tests

Serum	Strain	Agglutination with Serum in Titre of					
		1 in 10	1 in 30	1 in 100	1 in 300	1 in 1 000	1 in 3 000
Patient	Patient's	Trace	0	0	0	0	0
"	Jackson	0	0	0	0	0	0
Known positive	Patient's	Trace	+	+	+	+	Trace
" "	Jackson	0	+	+	+	+	Trace

Adhesion Tests

Serum	Strain	Adhesion with Serum in Titre of 1 in 20
Patient's "	Patient's	Weakly +
"	Jackson	0
Known positive "	Patient's	+
" "	Jackson	+

Professor Schuffner who was in London at the time very kindly interested himself in the matter and on his return to Amsterdam tested the patient's serum against various strains of leptospira, with the following agglutination results

Jackson English strain	+ 1 10
Schermerhorn Dutch strain	+ 1 30
Wijnberg Dutch strain	0
Schermerhorn formalin	0
Wijnberg formalin	0
Weil Berlijn German strain	0
Swart van Tienen Indian strain	0
Rachmat Indian strain	0
Salinem Indian strain	0
Hebdomadis B Japanese strain	0
Moskou Russian strain of mud fever	0
Hond Utrecht IV Dutch dog strain	0
Allane Dutch dog strain formalinized	0
Hond HC Indian dog strain	0
Waz, water spirochaete	0

These results show that, while the patient's leptospira were agglutinated by Major Brown's known immune serum the patient's own serum had only a feeble action against his own leptospira and apart from slight action against the 'Jackson and 'Schermerhorn strains no action against a number of strains of leptospira The practically complete absence of specific agglutinins from the patient's serum was remarkable in view of the long duration of the disease and it seems not unreasonable to assume that the chronicity of the illness must have been associated with an infecting strain of low virulence and with a feeble immune body response by the host

Treatment

Although repeated lumbar punctures and reduction of the pressure of the cerebro spinal fluid together with intravenous hypertonic saline produced temporary remissions of the headache the irregular fever continued and the patient's condition was deteriorating

A quantity of antileptospiral horse serum was therefore obtained This serum agglutinated the patient's leptospira at a titre of 1 in 300 with a trace of agglutination at a titre of 1 in 1 000 On June 17th 15 c cm of cerebro-spinal fluid were removed and were replaced by 10 c cm of this serum During the next twenty-four hours the patient had an exacerbation of symptoms with very severe headache and vomiting He then improved considerably and his temperature was normal for a week but on the eighth day the temperature rose and he had a severe attack of serum sickness with generalized urticaria, oedema, and joint pains lasting some days His nervous symptoms however were definitely alleviated the headache completely disappeared, and he became mentally bright and alert, his general condition also improved The only other treatment given at this time was a course of pil ferri 15 grains thrice daily for the anaemia

On July 15th the cerebro spinal fluid was again examined The pressure was 120 mm of water there was an increase of protein and, although quite clear the fluid contained 330 red cells per c mm but nevertheless the white cells were only 2 per c mm the chlorides were 689 mg per 100 c cm, and the sugar 40 mg per 100 c cm The fluid was inoculated into guinea pigs and culture medium, but no leptospira were recovered The blood and urine were also examined directly and by inoculation into guinea pigs and medium but no organisms were demonstrated Nevertheless the patient continued to run a slight irregular temperature, and he occasionally complained of pain in the left side of the abdomen Furthermore urine examined on July 23rd contained leptospira as one of the two guinea pigs inoculated on this day with the centrifuged deposit died of Weil's disease twelve days later

Also on July 23rd in view of the persistent pyrexia 20 c cm of the antileptospiral horse serum were administered intramuscularly Although this injection was preceded by a series of small graduated doses in an endeavour to desensitize the patient it was followed within a few hours by a sharp reaction with a temperature of 103 F a rigor, and vomiting In view of the agglutination titre of this serum against the patient's strain it seemed quite likely that this dose would prove insufficient and I suggested therefore before going on holiday that it might be necessary to obtain more serum The patient was also ordered campolon 4 c cm intramuscularly on alternate days, and ostocalcium tablets 21 grains thrice daily by mouth These preparations were continued for about a fortnight but no further serum was given as at the end of this period the patient's general condition had so much improved that he was allowed out of bed Although there were subsequently a few mild febrile oscillations never higher than 100 F the general progress continued and at the beginning of September the patient was looking and feeling very well The temperature had become normal the spleen was only just palpable the vision had improved remarkably and the urine by repeated tests was apparently free from leptospira Convalescence was interrupted by a short febrile attack associated with a small interlobar pleural effusion at the right base but no evidence was obtained that this was due to leptospira

Discussion

The two outstanding features of interest in this case are the long duration of the infection and the late onset of meningitic symptoms Usually Weil's disease takes the form of a febrile illness of abrupt onset with a primary pyrexia lasting about seven to ten days followed by a secondary rise of temperature of a few days duration during the third week Jaundice may or may not be

present, and as the illness progresses large numbers of leptospira are usually to be found in the urine Although convalescence is frequently slow, the fever and spirochaeturia are rarely much prolonged beyond the fifth or sixth week

Garnier and Reilly (1917) have, however, observed a certain number of cases where the febrile attacks were abnormally prolonged, and they record two cases where leptospira were recovered from the urine up to 100 and 103 days respectively In the first of these cases there was a series of febrile relapses over a period of more than three months, and leptospira were recovered from the urine on the occasion of each relapse, and for the last time on the hundredth day During the course of this illness the liver and spleen became definitely enlarged, and there was slight but persistent jaundice, so that the authors remarked that this hepato-splenic form of Weil's disease resembled what had been described as Hanot's disease In their second case jaundice was slight, and had disappeared by the twenty-seventh day, but successive attacks of fever continued until the sixty-second day Leptospira were still found, however, up to the hundred-and-third day, by which time the patient was definitely convalescent Although this patient could hardly be classed as a "carrier' in the usual sense of the term, it is not without interest to note that the parasites persisted in the urine for a month after the patient had become afebrile

As already stated, usually by the early part of the second month the urine in Weil's disease is free from leptospira, and only rarely do the organisms persist to the end of this month, so that the duration of infection in the two cases quoted is exceptional The case recorded in the present note is remarkable, then, for the extraordinarily long duration of the infection, the patient was ill and febrile for between eight and nine months, and leptospira were demonstrated in the urine more than thirty-three weeks from the onset of the disease

The other interesting feature of the case concerns the late onset of the symptoms of meningeal invasion and the recovery of the organism from the cerebro-spinal fluid practically six months from the beginning of the illness

Although meningitis is a well-known complication of Weil's disease it almost invariably occurs during the early acute stage of the illness Costa and Troisier (1917), reviewing a series of such cases and summarizing the dominant features, state that leptospiral meningitis is of abrupt onset, that it arises during the acute stage of the general infection, that the meningeal symptoms undergo remission and relapse in harmony with the course of the general infection, that the evolution of the meningitis is always favourable, that the prognosis is dictated solely by the general condition of the patient, that the meningeal infection leaves no sequel, and that normal function is completely recovered Furthermore, these authors draw attention to an important point when they add that in those cases where jaundice is absent the meningeal symptoms may completely dominate the clinical picture In this latter connexion it may be remarked that a number of cases of meningitis with acute onset, relatively short benign course, and no apparent epidemiological relationship to any known infectious meningeal disease, have been described from time to time under a variety of names, and are often referred to as examples of acute aseptic meningitis In these cases the cerebro-spinal fluid shows an increase of pressure and a polymorphonuclear or lymphocytic pleocytosis, but is sterile on culture It may not be without interest that five of a number of such cases in Paris, described by Laubry and Foy (1910), Laubry and Parvu (1910), and Guillain and Richet (1910), were associated with jaundice, and that Rist (1910), in discussion, remarked that there were simultaneously in Paris many cases of benign infectious jaundice It must be admitted that the few animals, including guinea pigs, inoculated with cerebro-spinal fluid from a number of the cases of meningitis remained quite well, and although at this time the causal organism of Weil's disease had not been recognized, the occurrence of Weil's disease in them would hardly have been overlooked It is to be remembered that even guinea-pigs often prove refractory to inoculation with leptospira Investigation of suspected cases must embrace, if necessary, repeated examination of the cerebro-spinal fluid The urine should likewise be examined, and it is worth noting that a greater measure of success may often be obtained if it is first rendered alkaline by treating the patient with alkalis In addition, the results of agglutination tests with the patient's serum are of considerable value

It is, of course, not suggested that cases of acute aseptic meningitis are necessarily examples of Weil's disease, but in the presence of any meningitis of unknown origin it would seem useful to consider the possibility of leptospiral infection This is emphasized because the fact that a leptospiral infection may have no other clinical manifestation than that of a pure meningitis seems to require wider recognition, as is apparent from the following quotation taken from a recent paper by Mollaret and Erber (1935) dealing with the diagnosis of this syndrome

"Incidément nous soulignerons la frequence relative de cette affection Pour la derniere saison épidémique de la spirochétose, nos examens à l'Institut Pasteur nous donnent un total d'une vingtaine de cas probables de formes meningees pures Une telle maladie exige donc d'etre mieux connue et peut être specialement à l'étranger En effet lors d'un séjour à Londres, en juillet aout 1935 l'un d'entre nous a pu constater que de tels faits paraissaient absolument inconnus des cliniciens anglais D'autre part, à l'Institut Wellcome le Dr Brown, qui effectue practiquement pour la Grande Bretagne la totalité des recherches serologiques concernant la spirochétose ictéro-hemorragique, n'avait jamais eu l'opportunite d'étudier un cas de ce genre

En Allemagne, aucune mention correspondante ne figure dans le grand traité de Bumke et Foerster (1935)"

Marie and Gabriel (1935), describing what they call an epidemic of spirochaetal meningitis in children, state that there was no certain clinical sign indicating the spirochaetal nature of the disease, which was only detected by sero-diagnostic tests and by infecting guinea-pigs from the urine of one of the patients Schuffner and Walch-Sorgdrager (1936), recording their observations on twenty-five cases of Weil's disease with meningeal symptoms, point out that meningitis occurred in 12 per cent of the cases without jaundice, and they add that in meningitis of obscure origin the possibility of Weil's disease should be considered Troisier, Barnety, and Macrez (1935) have described a simple febrile form of leptospirosis without jaundice, haemorrhages or any meningitic syndrome, and Kourilsky and Mamou (1935) have recorded forms without jaundice, but with symptoms suggesting influenza

Typical Weil's disease is now being more widely recognized in England and elsewhere, and it may well be that atypical forms will be found with increasing frequency as clinicians keep in mind their possibilities Among the number of authors who have discussed the meningitis of Weil's disease there seems to be general agreement that the nervous involvement is an acute disease, and that, where there is a typical attack of Weil's disease, the meningitis accompanies the acute phase of the general infection

While it is possible that in the case recorded in the present communication leptospira may have invaded the meninges during the typical stage of the infection, there was no nervous involvement of sufficient degree to attract any attention. The present case differs from those previously recorded in that the first manifestations of meningitis occurred more than four months after the onset of the illness. The only other record having any resemblance to this appears to be one given by Davidson and Smith (1936) who investigated an outbreak of Weil's disease in Aberdeen. They state that

> An interesting type of meningitis occurred in Case 32 six weeks after all signs of spirochaetal infection had passed. The patient was discharged from the City Hospital on 18/35 and was admitted to the wards of the professor of medicine, Royal Infirmary, Aberdeen, on 9/9/35 suffering from headache and great stiffness of the neck. Kernig's sign was present. The optic disks were swollen (2 D) and the edges blurred. No haemorrhages or exudates were seen. Lumbar puncture revealed a turbid fluid under pressure (265 mm.). Examination of the cerebro-spinal fluid revealed large numbers of cells, mostly polymorphonuclear leucocytes. Sugar 0·018 mg. per cent. Chlorides 657 mg. per cent. Total protein 50 mg. per cent. No organisms could be seen in the stained films or cultivated from the cerebro-spinal fluid. It was believed that the most likely diagnosis was a mild attack of meningococcal meningitis. Accordingly the daily removal of cerebro-spinal fluid was made and intrathecal injections of anti-meningococcal serum were given. The temperature remained elevated (100° to 102° F.) for twenty-three days, papilloedema gradually subsided, and the patient was discharged from hospital apparently cured. She was seen by one of the writers two months afterwards when she was in perfect health and no signs of central nervous system disease were present. The cause of this aseptic meningitis was never established nor could any definite conclusions be drawn in regard to its connexion with the preceding attack of leptospiral infection.

In this case the meningitis did not arise until six weeks after the patient had apparently recovered from the attack of Weil's disease. Nevertheless her cerebro-spinal fluid was not inconsistent with a leptospiral infection in that there was an increase of pressure, a polymorphonuclear pleocytosis, an increase in protein and diminution in chloride, while no organisms were found in stained films or by culture. A tuberculous infection was unlikely since two months later the patient was found to have made a perfect recovery.

The case recorded in the present communication differs, however, from this Aberdeen case in the following particulars. First, the present case arose during the course of an extraordinarily chronic but nevertheless active attack of Weil's disease and there was no asymptomatic interval or period of apparent recovery between the primary attack and the onset of meningeal symptoms. Secondly, the nervous involvement progressed steadily over a period of two months and until specific treatment was instituted, showed no sign of improvement or of remission.

In conclusion this case demonstrates that Weil's disease may be a much more chronic infection than hitherto considered, and it shows an interesting and possibly significant fact in that the patient's urine contained leptospira thirty-three weeks from the onset of the disease. It also reveals that meningitis of a progressive type may arise at a late stage in the present instance months after the typical manifestations of Weil's disease had subsided and the jaundice had long disappeared. Finally there is the anomalous finding that the patient's serum possessed practically no power of agglutinating the specific organism.

Summary

1. A prolonged case of Weil's disease associated with *meningitis* of a progressive type is described.

2. No sign of meningitis was recorded during the early typical stage of the disease which was accompanied by jaundice and the first evidence of meningeal invasion was only observed four months after the beginning of the illness.

3. Although the patient had apparently had an attack of visceral Weil's disease in December 1935 and was still infected months later it is to be noted that both his serum and cerebro-spinal fluid possessed practically no agglutinating power against the infecting organism and against various other strains of leptospira.

4. The diagnosis was made by demonstrating the *organism in the cerebro-spinal fluid and urine by guinea-pig* inoculation.

5. Leptospira were recovered from the cerebro-spinal fluid and from the urine up to twenty-five and thirty-three weeks respectively from the onset of the disease.

6. Until an anti-leptospiral serum was administered the illness was apparently steadily progressive.

7. The meningitic manifestations of Weil's disease are discussed, and since the disease may occur without jaundice attention is particularly drawn to the necessity for considering this infection in any obscure case of meningitis. Indeed since Weil's disease may fail to present any specific syndrome its possibility should be borne in mind in any case of obscure pyrexia.

C. D. Bartels (*Hospitalstidende*, September 15th, 1936, p. 2) reviews his experience of 230 cases of hypertrophy of the prostate. Seven cases of cancer were found in the group of ninety-one patients on whom prostatectomy was performed. In none of these cases was the diagnosis of cancer made before the operation. There were altogether eighteen cases of cancer among the author's prostatic patients and in as many as three of them the cancer developed a considerable time—one six and twelve years respectively—after the prostatectomy. In none of these three cases had a histological examination of the removed prostate shown any sign of cancer at the time of operation. With regard to operative treatment the author insists that to ignore the findings of functional renal tests is to court disaster but he tempers this warning with the reservation that no one functional test is sufficient as a guide to operation and that a single unsatisfactory report of a functional test should not warrant forthwith the stamping of a case as inoperable seeing that the renal disease of prostatics is eminently curable and can disappear under treatment with a catheter or cystotomy. In the preparation of the patient for an operation it is important not only to relieve the back pressure on the kidneys but also to allow plenty of time for the adequate regeneration of the tubular epithelium. And this may take weeks and months and in some cases even years

NUTRITIONAL ANAEMIA IN THE EAST END OF LONDON

BY

LEONARD FINDLAY, M D , F.R C P.

Physician Princess Elizabeth of York Hospital for Children

The investigation described in the present communication was undertaken in an attempt to gain some idea of the incidence of so called nutritional anaemia among the poorer-class children of the East End of London The subjects of the study comprised some 290 patients admitted during the past two years under my care to the Princess Elizabeth of York Hospital for Children It might be argued, of course, that this is not suitable material for the purpose, and admittedly complicating factors such as hydraemia and anhydraemia may be introduced and so obscure the true state of affairs However, much of our knowledge of the physiological has been obtained from a study of just such material, and the uniformity of the findings would seem to go some way in disposing of this objection Nevertheless, the nature of the material must be borne in mind when evaluating the results and attempting any application to the population as a whole In this regard it was felt at the outset that in view of the current belief that anaemia increases the morbidity rate a specially high incidence of anaemia would be found in this particular section of the population, but, as will be seen from the records which follow, this expectation was not fulfilled

There has been no selection of the material excepting that a few examples of leukaemia, acholuric jaundice, anaemia following haemorrhage of the newborn, purpura haemorrhagica, and coeliac disease (all conditions in which nutrition does not play a specific part) have been excluded Children suffering from acute pulmonary disease (pneumonia), pyelonephritis, meningitis, rheumatic infection, gastro-enteritis, and debility are however, included A certain proportion of the children presented absolutely no signs of disease and had come under observation because of indefinite malaise The children, varying in age between a few days and 14 years, all underwent one blood examination within a day or so of their admission to hospital, and in the classification of the results no distinction is drawn between the sexes, because it was found that the curves for boys and girls were identical

The patients admitted to the Princess Elizabeth of York Hospital come from the poorest stratum of society, the fathers for the most part being casual labourers, 25 to 30 per cent of whom were during the time of the inquiry the victims of unemployment It is also worth remembering in this connexion that the district surrounding the Princess Elizabeth of York Hospital was quoted in the recent Government survey of housing as the black spot of the country for overcrowding Here surely, if anywhere, nutritional anaemia might well be expected to abound

The blood was taken from the ear, except on a few occasions when the finger was the source, and the haemoglobin was estimated in all instances by Haldane s method, the test colour being standardized at least every four months As the object of this investigation is to obtain some measure of the incidence of anaemia, and of its severity when present it is apparent that this can be attained only by finding how the individual figures fall in relation to the normal or physiological limits An average of the findings would not only be quite useless for such a purpose but might be quite misleading, because with such a method any unduly low readings might be more than compensated for and obscured by others abnormally high Hence in the charts (I and II), demonstrating the findings, the individual estimations are shown in relation to the accepted range of the normal, the lower level of which is represented by a continuous line This lower level—the borderline of anaemia—corresponds to a level of 10 per cent below the average given by Hutchison (1909) and by Holt and McIntosh (1933) as found in healthy children In this connexion it may be pointed out that this level is in close agreement with the minimal findings recorded in healthy children by Merritt and Davidson (1933) of New York, Drucker (1923) of Copenhagen, and by Perlin (1903) of Berne

Haemoglobin Content

In Chart I are plotted the individual haemoglobin estimations, shown for each month during the first year of life and for each year thereafter up to 14 years The continuous line on the chart shows, as already noted, the lower limit of normality according to the findings of various authors in large numbers of healthy children resident in Europe and America It will be noted that the general trend of the haemoglobin reveals the well-known high level present immediately after birth, the rapid fall during the early weeks of life but tapering off later, and the recovery during the later months of infancy, which is continued throughout childhood

It will be noticed also that a certain number of estimations fall below the level of normality The majority of these, however, occur during the first months of life, and these examples of anaemia are probably the result of congenital causes In many instances the low reading may be simply an expression of haemolysis of the newborn, whatever the cause of this may be, which is acting in an abnormal degree In some cases the cause may be prematurity, with a consequent insufficient store of iron at birth, or it may have been due to anaemia of the mother and her inability to supply the normal needs of the foetus How far these different aetiological factors were at work in our cases we cannot say, but in some of them the anaemia was due to severe maternal haemorrhage during labour, or undue bleeding from the cord, both of which factors, we think are not sufficiently considered in attempts to account for anaemia in the very young infant

We have had under observation during the first week of life twins, one of which (the first born) was quite normal, whereas the other (the second born) was markedly anaemic, and the only discoverable aetiological factor was a severe uterine haemorrhage between the delivery of the first and second twin But whatever may be the cause of these examples of anaemia during the first three months, a dietetic factor (deficient intake of iron) cannot be invoked, as it has never been found possible to prevent the fall in haemoglobin at this age by the administration of iron in ample amounts One specially remarkable feature in the results is the extreme rarity of low readings during the latter half of infancy (6 to 12 months) in view of the current opinion that nutritional anaemia is very common at this age

Although the majority of pathological findings in the cases here recorded were during the first three months of life, a few were met with throughout the whole period of childhood This, of course, is not to be wondered at, since many of the children were moderately ill on admission to hospital and suffering from such conditions as pyelonephritis, septic bronchiectasis bronchopneumonia, and rheumatic carditis and pericarditis But the really striking feature of the investigation is that for the most

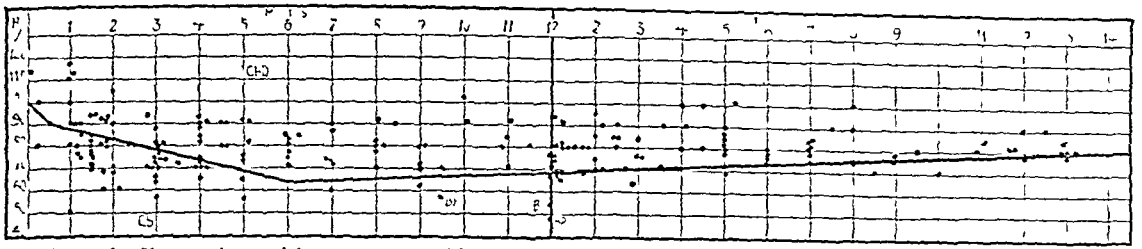

CHART I—Showing haemoglobin estimations The black line shows lower limit of normal CS = congenital syphilis M = meningitis B = bronchopneumonia P = Pyelonephritis CHD = congenital heart disease

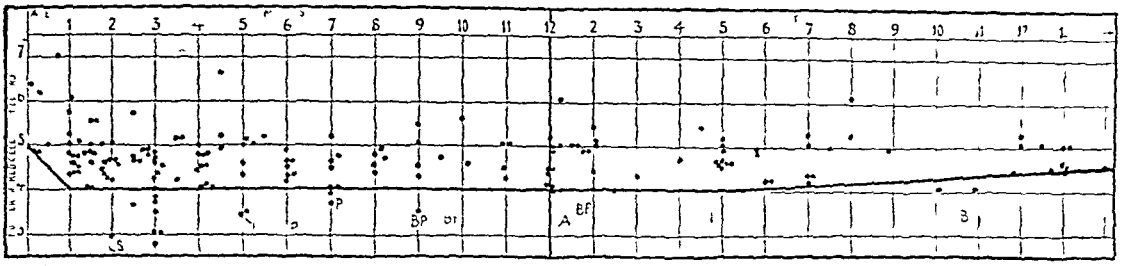

CHART II—Showing red cell estimations The black line shows lower limit of normal M = meningitis P = pyelonephritis BP = bronchopneumonia A = septic arthritis N = nephritis B = bronchiectasis C = congenital syphilis

part the readings fall within the range of the physiological, and therefore do not suggest any great incidence of anaemia of a nutritional or any other variety

Red Cell Count

In Chart II the red cell estimations are represented in the same manner as were those for haemoglobin The continuous line delimits the lower range of the physiological according to Hutchison (1909) and Holt and McIntosh (1933) and thus it is only those readings which fall below this level that can be taken as evidence of anaemia The red cells show the same general behaviour as the haemoglobin—a fairly wide variation, a high initial value, and a fall during early infancy with a later recovery, which is continued throughout childhood In the case of the red cells just as was noted with regard to the haemoglobin the great majority of the figures fall within the range of the physiological And again the majority of anaemic readings are during the first months of life although an occasional slightly subnormal value is observed at every period of childhood But it will be noted that for the most part these low readings were found in examples of severe toxic conditions, in which a more probable aetiology is seen than in that of a deficient iron intake Another feature deserving comment is the parallelism between the haemoglobin and red cell estimations a fact which by itself militates against any idea of nutritional anaemia

Conclusions

1 Examination of the blood of the sick child in the East End of London reveals for the most part normal haemoglobin and red cell values

2 Anaemia when present during infancy is most frequent during the first three months and is probably the result of congenital causes or of haemorrhage at birth

3 Anaemia occurring during later infancy and childhood is rare, and when present, is probably the result of toxic conditions

4 There is no evidence from the section of the population studied that nutritional anaemia is common

DIAGNOSIS OF MALIGNANT DISEASE OF THE PHARYNX

BY

ROBIN PILCHER, F R C S

First Assistant in the Surgical Unit University College Hospital

It is now about a quarter of a century since the technical difficulties of the surgical treatment of cancer of the pharynx were solved The chance of cure which lateral pharyngotomy holds out might have been expected to stimulate interest in the early diagnosis of this common form of malignant disease It is a fact however that recognition of these growths in their early stages upon which any successful application of surgical excision depends is still a rare event

Before describing in detail the symptoms of carcinoma of the pharynx there are two points which I wish to emphasize The first is that the early symptoms of this disease are trivial in nature but although superficially resembling trivial symptoms of less significance they have certain peculiarities which should always arouse suspicion of malignancy The lack of familiarity with these early symptoms is doubtless largely due to the overwhelming nature of the major symptoms which always supervene sooner or later The patient with severe dysphagia urgent dyspnoea or continual pain is unlikely to dwell on the minor disturbances which preceded them, and in the presence of an obvious case of malignancy there is little temptation to the busy practitioner to probe into the past history

The second point is that in the majority of cases when symptoms first appear, some abnormality can be seen by

indirect laryngoscopy it is in a wider use of this simple method of examination that there lies most hope for an improvement in diagnosis The use of the laryngeal mirror is not the prerogative of the specialist, nor for the purpose with which we are concerned does it require the specialist's skill In what follows the elaboration of these two points will be my chief object

Distribution

The tumours which I have chosen to discuss fall within the anatomical limits of the epiglottis above and the lower border of the cricoid cartilage below Those above the epiglottis do not present the same difficulties in diagnosis, being, with the exception of the nasopharyngeal, accessible to direct examination Within these limits the vast *majority of malignant tumours* are squamous carcinomata In the oropharynx and nasopharynx the pathology is more varied, and many of the tumours are of lymphatic origin Below the epiglottis there is little lymphoid tissue in the pharyngeal wall, and tumours arising from it are very rare

Squamous carcinomata of the region defined fall into well-defined groups according to the sites at which the neoplasm starts, and it is one of the peculiarities of the disease that these groups have a very definite sex distribution These sites are (1) the epiglottis, (2) the aryepiglottic fold, (3) the lateral wall, (4) the pyriform sinus, and (5) the post-cricoid region For convenience the first four are grouped together as epilaryngeal, the fifth is often referred to as hypopharyngeal

The epilaryngeal cancers occur almost exclusively in men, the hypopharyngeal exclusively in women A further difference between them is that the hypopharyngeal tend to occur about ten years earlier than the epilaryngeal The anatomical distribution of 100 consecutive cases seen at this hospital in the years 1926–35 inclusive is shown in Table I, the age distribution of the same series in Table II

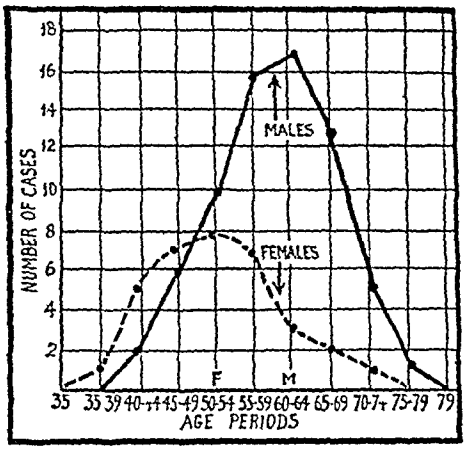
TABLE I —*One Hundred Consecutive Cases of Carcinoma of the Pharynx*

(Period of observation Ten years—1926–35)

Sex	Total Cases	Epilaryngeal	Post-cricoid
Male	70	70	None
Female	30	1	29

The epilaryngeal group includes tumours of the epiglottis the lateral wall of the pharynx, the aryepiglottic fold, and the pyriform fossa

Symptomatology



The symptomatology of the disease may conveniently be considered under the two main groups defined above It is not necessary to consider separately the four types in the epilaryngeal group Their differentiation is important to the surgeon, but of no moment in diagnosis

EPILARYNGEAL GROUP

The commonest early symptom in this group is a persistent abnormal sensation in the throat, which is variously described, it may be a sore throat, a tickle, a feeling of a lump or a little pain on swallowing Whichever of these it be, there are two features that should arouse suspicion of malignancy The first is that the patient is able to locate the sensation to a definite part of the throat, and the second is its persistence Sometimes the symptoms start with the supposed arrest of a crumb or small bone in the throat and the patient complains that his throat feels as if the foreign body were still present Too often of course the patient himself decides that nothing serious is wrong and neglects to consult his doctor until more urgent symptoms develop, but this failure to attach due importance to these sensations is by no means confined to the patient

Next in frequency among the initial symptoms is the presence of enlarged glands in the neck, this type of case will be considered later Another symptom that may be present early is some interference with the voice The presence of the tumour may alter the resonance of the voice, or it may infiltrate the arytenoids and limit the movements of the cords

TABLE II —*Age Incidence of 100 Cases of Cancer of the Pharynx*

Sooner or later dysphagia occurs, and at the time of admission this is most commonly the dominant symptom In some of our case histories dysphagia is the first symptom noted, but it is doubtful whether it ever occurs without any preceding abnormal sensations I have already mentioned the tendency to overlook minor symptoms when the major have supervened

POST-CRICOID CARCINOMA

In the history of the typical case of post-cricoid carcinoma there are two features which, if their significance were realized, would always arouse suspicion of malignant disease, but which unfortunately more often have the reverse effect of allaying such suspicion The first is that the patient says that she has for many years, sometimes all her life, had some slight difficulty with deglutition This all too often makes one suspect the patient of hysteria, whereas it is a most important indication of the possibility of post-cricoid cancer The second is that, when other symptoms are added, they are at first intermittent Perhaps the patient has a sudden difficulty during one meal with a fit of choking or a sensation of a bolus sticking in the throat, and then no more trouble for a week or two

The fact that the dysphagia is a single incident, or appears as a few such incidents separated by intervals of freedom, is very likely to lead to its dismissal as something trivial So important do I regard this combination of symptoms that I consider a single serious attack of dysphagia in a patient with a long history of slight difficulty to be an indication for a thorough examination, if necessary including oesophagoscopy

In the later stages dysphagia of a persistent type becomes the dominant symptom, overshadowing all others Owing to the position of the growth obstruction to the passage of saliva is usually a prominent feature when real dysphagia begins The saliva collects in a pool behind the arytenoids, and has frequently to be coughed up because it tends to overflow into the larynx I shall refer again to the importance of the pool of saliva in laryngoscopy

Interference with the movements of the cords is common in this type and sometimes a change in voice is the first symptom for which the patient seeks advice Another symptom that may occur early is a little pain and tenderness in the neck due presumably to extension of the growth outside the pharynx

Common to both groups, and in our series more frequent in the epilaryngeal is the occurrence of glandular enlargement as the first symptom Any patient at or past middle age who develops enlarged glands in the neck should be suspected of malignant disease The teeth and tonsils seldom give rise to such enlargements for the first time in the second half of life All too often, however, they are held responsible and removed In a case of carcinoma of the pharynx this is a most unfortunate error, since the elimination of oral sepsis always improves the condition of the pharynx and, if the growth is latent, diagnosis will be further delayed

There can be no doubt that sepsis plays an important part in the evolution of a pharyngeal cancer and its aggravating effect on the symptoms is such that the chances of early diagnosis are much greater when it is present than when the mouth is clean Moreover so dramatic may be the improvement after its elimination that no case can be dismissed as inoperable on the local signs in the pharynx before the teeth have been extracted It is perhaps unfortunate that the majority of women who develop post cricoid carcinoma are edentulous It may well be for this reason that when symptoms first occur *in this type the growth is often surprisingly large*

Some indication of the relative frequency of the symptoms enumerated is given in Table III It must be understood that these data are taken mostly from students case histories written with no special knowledge of the disease, and often all too brief

TABLE III—*One Hundred Cases of Cancer of Pharynx*

First Recorded Symptoms

Abnormal sensations in the throat males 30 females 13
- Sore throat
- Pricking sensation
- Intermittent soreness
- Dry throat
- Relaxed throat
- Tickle in throat
- Roughness in throat
- Pain on swallowing
- Pain in tonsil
- Excess of phlegm in throat
- Feeling of a lump in throat

Enlarged glands males 22 females 1
Dysphagia males 10 females 11
Hoarseness males 7 females 1

Dominant Symptom on Admission

Dysphagia males 32 females 25
Stridor males 4 females 1

Diagnosis

I shall refrain from any systematic account of all the possible manifestations of carcinoma of the pharynx since I am only concerned with the early diagnosis of the disease If a patient seeks advice for any of the symptoms enumerated previously it may be possible sometimes from palpation of the neck alone to decide that the patient is suffering from malignant disease In most cases however this is not possible, and there is only one method that is readily available whereby the significance of the symptoms can be determined—namely indirect laryngoscopy It follows that every patient who has a persistent or recurrent abnormal sensation in the throat should be examined with the laryngeal mirror In the majority of cases when symptoms first appear there will be some visible abnormality

I have already mentioned that no great skill is necessary to detect the signs of carcinoma of the pharynx with the laryngeal mirror In every clinical examination however it is useful to know what to look for and laryngoscopy in these cases should be performed with certain possibilities in mind The abnormalities that may be found are as follows

1 *Ulcer or Tumour*—The site and extent of the lesion is unimportant a single glimpse is all that may be necessary to show that a growth is present

2 *Swelling of the Arytenoids*—The mucous membrane over these structures is very sensitive to circulatory disturbances and readily becomes swollen in the presence of adjacent growth or sepsis If the arytenoids are swollen it indicates organic disease and it does not matter in the first instance if the growth cannot be seen

3 *Alterations in the Movement of the Arytenoids*—The arytenoids may be fixed by infiltration or by recurrent nerve palsy They are much easier to see than the vocal cords and in a difficult case it is much better to study their movements than to struggle for a glimpse of the larynx itself

4 *Abnormal Accumulations of Mucus or Pus* (i) *in the pyriform fossa and* (ii) *in the hypopharynx*—These two parts of the pharynx must always be examined during phonation which opens up the recesses and may reveal abnormalities not visible with the larynx at rest

It is not possible to see the whole pharynx in a single field of vision and it is therefore necessary to tilt the mirror to examine in turn the epiglottis the arytenoids and aryepiglottic folds the lateral and posterior walls the pyriform fossa and the hypopharynx Phonation is necessary to show the movements of the arytenoids and to open up the pyriform fossae and hypopharynx

In the epilaryngeal group an ulcer or tumour can usually be seen, except in the early pyriform cases In these the only abnormality may be an accumulation of muco pus in one pyriform sinus or oedema or limitation of movement in the adjacent arytenoid In the post cricoid group three stages may be recognized with the laryngeal mirror In the first there is an accumulation of mucus or muco pus behind the arytenoids in the second there is in addition some oedema of the arytenoids in the third the edge of the ulcer is seen projecting from the pool of mucus At any stage limitation of movement of the arytenoids may be observed

It is not to be supposed that indirect laryngoscopy solves all diagnostic difficulties in cases of carcinoma of the pharynx it will seldom fail however to reveal some abnormality It is a great responsibility to decide whether further investigation of a case with negative findings is necessary But if there is a reasonable suspicion of malignancy it should not be dismissed until all possible methods of investigation have been employed The only certain way to detect an early carcinoma of the hypopharynx is by oesophagoscopy and it requires courage to insist on this when the patient's symptoms are still of a trivial nature There is however no escape from the fact that this disease always starts with trivial symptoms and our only chance of making early diagnoses lies in regarding every case of persistent or recurrent abnormal sensation in the throat as a possible example of malignant disease

Since the practical applications of this principle will mean much extra trouble both for the patient and for the doctor it may well be asked whether there is anything to be gained by early diagnosis whether in fact it would not be better to leave the patient in peace until his serious

symptoms develop I can give you no dramatic statistics to confound the attitude of *laissez-faire*, but I can state and show by examples that the disease is curable by surgery

The results of the application of surgery in the 100 cases of carcinoma of the pharynx is shown in Table IV

TABLE IV—*Operative Treatment in One Hundred Cases of Cancer of Pharynx*

Operable
49 cases 35 males 14 females
Radical Operations Completed
25 males mortality 9, alive 4
14 females mortality 7, alive 3

You will see that the operability rate is fairly high, but it must be understood that "operable" in this hospital is a somewhat elastic term, many of those that were submitted to radical operation were really advanced cases The fact that operation can occasionally succeed in apparently hopeless cases may be taken as an indication that the type of growth is not essentially very malignant The mortality of the treatment is high, again partly on account of the advanced state of the disease in many cases, but also on account of the severity of the operation Seven of the hundred patients are alive as the result of surgical treatment alone, the longest interval since operation being ten years, the shortest eighteen months Other cases in this 100 have been relieved by radiotherapy, but there are as yet no long-standing survivals as a result of this treatment

These few successes show that these forms of malignant disease are curable by surgery It has yet to be shown that any other method gives better results But, whatever method of treatment is favoured, it will obviously have more chance of success if diagnosis is made early

Summary

Cancer of the pharynx begins with trivial but characteristic symptoms

A plea is made for closer investigation of minor disturbances of the voice and of swallowing

Indirect laryngoscopy is the most useful method of examination in suspicious cases

The disease is curable by surgical excision

ULTRA-VIOLET IRRADIATION IN THE TREATMENT OF VARICOSE ULCERS, VARICOSE ECZEMA, AND VARICOSE VEINS

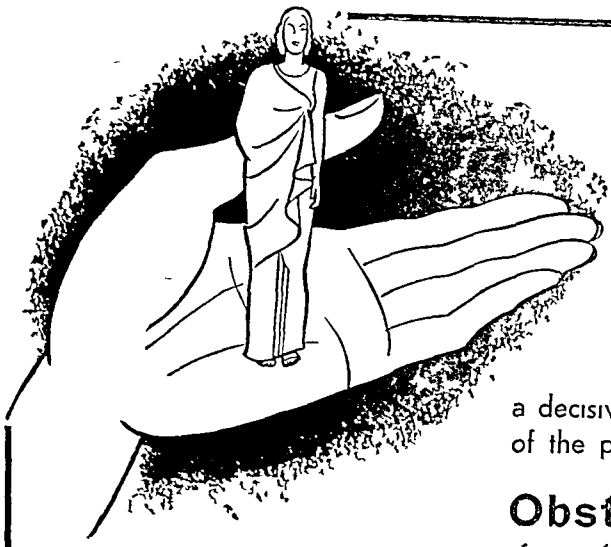
BY

ALBERT EIDINOW, M B, B S Lond

Honorary Physician to the St John Clinic and Institute of Physical Medicine Pimlico and to the Light Department of the Radium Institute

When taking charge of the light department of the St John Clinic four years ago some ninety-two patients suffering from varicose ulcer and varicose eczema had been attending once or twice a week for over three years Although they had regularly received local treatment with ultra-violet rays emitted from the tungsten arc their lesions did not heal The technique of treatment was changed to methods which will be fully described, and after three months sixty-six of these patients were completely healed and discharged cured (72 5 per cent)

Briefly the technique adopted included (1) exposure of the ulcer and the skin area 1 to 1½ inches surrounding the edge of the ulcer to massive doses, equivalent to six erythema doses of rays, emitted from the quartz air-cooled mercury vapour lamp, (2) application of adhesive elastic bandages The result of such treatment has been consistently successful In past years many clinics and hospital out-patient departments have contained numerous patients attending regularly for long periods, months and years, for treatment of chronic varicose ulcer Much tiring labour applying dressings was the task of nurses, doctors, and their patients The difficulties of the economic 'home conditions" and finance of these patients made the task of healing varicose ulcers and the hygiene of clean limbs almost impossible Many such patients have to work for a living The introduction of elastic adhesive bandages has been a great boon The exposure to ultra-violet rays of wave-length shorter than 3,000 Angstrom units sterilizes the surface of the ulcerated area and augments the circulation this promotes the healing and makes the surface wound inoffensive and free from unpleasant odour



Technique of Treatment

The size and nature of the ulcerated area of skin is recorded by direct tracing over a piece of transparent tissue paper with a dermatograph pencil This tracing is transferred to a sheet of foolscap paper, and the area of unhealed skin is recorded week by week, so that observation as to the nature and rapidity of healing can be observed The leg and ulcerated area is then cleansed with acetone and oil of eucalyptus A piece of tissue crêpe paper is next applied to cover the whole leg The paper covering the ulcer and the skin area surrounding this for 1 to 1½ inches is cut away, and pieces of adhesive strapping are applied to support the paper covering the healthy skin of the leg and foot The ulcer area and surrounding skin is then exposed to the rays of the quartz air-cooled mercury vapour lamp at a distance of 12 inches for ten minutes A vacuum type of quartz air-cooled mercury vapour lamp, consuming 2 5 amperes and 105 volts between the electrodes is employed This is equivalent to five times the erythema dose of the normal white skin

Immediately after exposure the tissue paper is removed and an elastic adhesive bandage is tightly applied from the base of the toes, over the foot including the heel, and up the leg to the knee The patient is instructed to keep the bandage clean but not to interfere with it in any way It is kept on for one week, when the patient again reports The bandage is then removed, the skin is cleansed with acetone, and the treatment repeated Week by week the ulcer area becomes smaller and smaller until healing ultimately occurs

It is indeed amazing to see the clean ulcer area exposed when the bandage is removed Although this bandage has been left undisturbed for one week and covers a septic discharging ulcer, the surrounding skin remains clean, with no foul odour and no evidence of reinfection or undue inflammation The use of elastic adhesive bandage has been of great help in augmenting the circulation, supporting varicose veins, and healing varicose ulceration The application of erythema doses of ultra violet rays is of much value in accelerating the formation of granulation tissue and stimulating the skin cells

It is impossible to obtain a consecutive series of similar clinical types to make a critical comparison of the effect of elastic adhesive bandage alone and the added effect of exposure to ultra-violet rays The exposure of varicose ulcers to ultra-violet rays in mild suberythema doses is of no avail, more intensive dosage equivalent to five skin erythema doses causes local inflammatory reaction, and

The destiny of the woman—in the hands of the physician

The timely and thorough medical treatment of female genito-urinary diseases is frequently a decisive factor in the health and happiness of the patient

Obstinate Leucorrhoea

of an infectious or non infectious character (Gonorrhoea, post gonorrhoeal conditions, trichomonas colpitis, constitutional catarrh, etc) can be treated simultaneously from two or three directions in a particularly active and effective manner by means of

> I know from my own experience with what difficulties one has often to contend in cases of obstinate leucorrhoea of various types and how often the desired result is still not achieved. Every one of my colleagues will welcome a new absolutely reliable method of treating this crux.

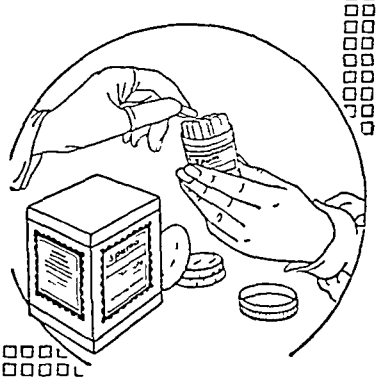
Survey of the indications

Spuman therapy provides the most suitable remedy for every description of leucorrhoea

Leucorrhoea of constitutional origin *Spuman cum lactic acid*

Gonorrhoea (including the ascendent form) purulent inflammation of the urethra vulvovaginitis gonorrhoica *Spuman cum silver protemate Spuman cum silver nitrate Spuman cum zinc sulphate Spuman cum ichthyol*



Postgonorrhoeal leucorrhoea leucorrhoea associated with trichomonas *Spuman cum salicylic acid*

Adnexitis parametritis inflammatory tumours *Spuman cum salicylic acid Spuman cum ichthyol*

Endometritis portio erosions *Spuman cum salicylic acid Spuman cum tannin Spuman cum ichthyol Spuman cum zinc sulphate*

Douglas pains *Spuman cum ichthyol*

Leucorrhoea resulting from carcinomatous ulcers *Spuman cum zinc sulphate*

ANAHÆMIN B.D.H.

in pernicious anæmia

According to a recent report (Lancet, December 26, 1936, p 1513) the power of Anahæmin B D H to cause blood regeneration in pernicious anæmia exceeds even that of the original product (see report of the Medical Research Council, 1931-1935, page 16), the daily injection of so little as one-twenty-fifth of 1 c c producing a rapid increase in the red blood count

In average cases of pernicious anæmia, however, the treatment recommended is to give an initial dose of 2 c c of Anahæmin B D H followed by 1 c c at 10 day intervals until the blood count has remained normal for at least a month In maintenance the routine treatment is to inject 2 c c monthly, but, if desirable, the interval between injections may be as wide as two months, provided 5 c c are injected on each occasion

Besides being submitted to clinical trial, every batch of Anahæmin B D H is required, before issue, to pass stringent biological, chemical, physical and bacteriological tests

DEA SALUS WHOSE CULT IN ROME WAS VERY OLD, WAS FIRST ASSOCIATED WITH THE PUBLIC WEAL IN A GENERAL SENSE LATER, SHE BECAME THE GODDESS OF PUBLIC HEALTH.—The cult of Salus existed before the building of her temple on the Quirinal in 302 B C This temple dedicated to her as Salus Publica, had the unusual distinction, in Rome of that period, of having its walls painted with pictures It was struck by lightning four times and, in the reign of Claudius, was destroyed by fire Salus became identified with the Greek Hygieia and was sometimes represented as the cult-companion of Æsculapius The appearance of medical divinities on coins indicates that the emperor had been ill or that the State had been delivered from some disaster The coin of Severus Alexander here reproduced shows Salus feeding her snake

After-care of varicose legs

"After discarding the cotton elastic adhesive bandages which the patient has worn during the injection treatment, it is a wise plan to maintain for a few weeks the 'bandage-pressure' by means of a half-spread cotton elastic adhesive bandage such as SEMIPLAST In this type of bandage only the first turn of the zinc oxide emulsion comes into contact with the skin This type of bandage is also advisable for a few weeks in cases of cured ulceration Pressure is to be maintained while the patient takes increasing exercise"

THE CLINICAL AND BIOCHEMICAL SYNDROME IN LYMPHADENOMA AND ALLIED DISEASES INVOLVING THE MESENTERIC LYMPH GLANDS

BY

N HAMILTON FAIRLEY, M D, D Sc, F R C P

Assistant Physician and Director of Pathology Hospital for Tropical Diseases London

AND

F P MACKIE, M D, F R C P, F R C S

Pathologist Hospital for Tropical Diseases

(WITH SPECIAL PLATE)

From time to time during the past six years adult patients have been admitted to the Hospital for Tropical Diseases who present what for teaching purposes may be described as the sprue abdomen, yet subsequent investigation has revealed another cause There is a history of diarrhoea or looseness of the bowels associated with the passage of large pale offensive, fatty, and gaseous stools Wasting is marked The skin is harsh and dry and sometimes shows brownish yellow discoloration The abdominal muscles are atrophied and not infrequently a doughy feeling is imparted to the examining fingers Abdominal distension may be marked Decreased physical reserve and hypotension are always present anaemia, muscular cramps, tetany and lingual features may occur

The similarity to sprue, however, does not end here, for laboratory investigation generally reveals a common biochemical background consisting of (1) a high percentage of faecal fat, which is generally adequately split (2) a flat type of glucose tolerance curve or one showing a delayed maximal rise and (3) decreased serum calcium associated with normal or low blood phosphorus These features are not invariably present in every case The bilirubin content of the plasma is normal or only slightly increased Haematological investigations may reveal a typical megalocytic anaemia with hyperchromia, orthochromia or even hypochromia In other instances the anaemia may be normocytic with orthochromia or microcytic with hypochromia

The conditions in which one of us (N H F) has personally encountered this sprue like syndrome in adults include idiopathic steatorrhoea, some of which were undoubted examples of adult coeliac disease, gastro colic fistula due to carcinoma, post operative gastro jejunocolic fistula (1931) and the present series which includes lymphoma lymphadenoma and lymphosarcoma involving the mesenteric lymph glands Defective intestinal absorption of certain fundamental food elements is common to the group

Ryle (1924) described lacteal obstruction with gross overloading of the lacteals with chyme in children with tuberculosis of the mesenteric lymph glands Clinically they showed stunting of growth anaemia of either macrocytic or microcytic type, bony changes tetany, and bulky, fatty stools Not all these features were present in each case Ryle pointed out that tabes mesenterica coeliac disease, and sprue were strikingly similar He suggested that obstruction of the lacteals might constitute the basis of all these diseases and that the lacteals would not be obviously dilated at a time when inadequate food was being taken Davenport Jones (1924) in Bombay reported that he had observed distended lacteals in a case of sprue operated on for appendicitis Mackie and Fairley (1929) examined the abdominal lymph glands and the receptaculum chyli at necropsy in cases of sprue in the Tropics but failed to find any abnormality or evidence of obstruction of the mesenteric lymphatic system such as would lead to interference with the absorption of fat from the small intestine Since then the same authors have performed a number of other necropsies on patients dying in London from sprue and examined soon after death without finding either enlargement of the mesenteric glands or evidence of lacteal obstruction

There is no reliable evidence that mesenteric lymphatic obstruction constitutes the basis of defective intestinal absorption in sprue idiopathic steatorrhoea or coeliac disease On the other hand it appears to underlie the clinical and biochemical picture shown in the present series of mesenteric adenopathies which are being reported with the object of interesting those seeing more patients of this type than are available in a hospital dealing essentially with tropical diseases A combined clinical pathological and biochemical study of such cases might well throw new light on the physiology of intestinal absorption

ILLUSTRATIVE CASES

Case I

A man aged 62 was admitted to hospital on February 19 1936 with the following history He had had a healthy childhood and had worked for thirty years with the London County Council without the loss of a single day In February 1935 he had had a carbuncle on his face which required treatment for five weeks After this he felt run down Diarrhoea commenced at the end of May 1935 and he rapidly lost weight

FIRST ADMISSION

On June 18 1935 he was admitted to St Alfege's Hospital Greenwich where the medical findings were as follows

The Prevention of
Post-Operative Abdominal Distension

PITRESSIN, the pressor hormone of the posterior lobe of the pituitary gland, is being increasingly used as routine practice for the prevention of intestinal relaxation and ileus following abdominal operations Though the effect of pituitary preparations on the intestinal musculature had been frequently studied by numerous investigators, it is comparatively recently that Potter and Mueller established the value of injections of the pressor hormone in post-operative cases (*Annals of Surgery* September, 1932) They concluded that the routine use of Pitressin is an effective means of minimising post-operative abdominal distension, when Pitressin is administered before the onset of intestinal smooth muscle relaxation, the result is a quiet abdomen without evidence of increased peristalsis, no untoward results were observed following its use in 200 cases

The dose suggested is 0 5 or 1 c c, repeated at four-hourly intervals for ten or twelve doses In some cases complicated by peritonitis the injections may be continued for as long as a week

'PITRESSIN'

Pitressin is the pressor hormone separated from posterior pituitary extract, and is issued in ampoules of 0 5 c c and 1 c c in boxes of six and twelve ampoules Further details will be supplied on request

PARKE, DAVIS & COMPANY, 50 BEAK STREET, LONDON, W 1

Laboratories Hounslow, Middlesex *Inc U S A, Liability Limited*

Examination showed an emaciated man with a sallow complexion a dry shrivelled tongue and a tumid abdomen The stools were pale and fatty, containing numerous fatty acid crystals total fat 55 per cent , neutral fat, 10 5 per cent , fatty acids and soaps, 44 5 per cent The fractional test meal at the end of one hour showed total acid, 50 c cm N/10 per cent , free acid 30 c cm N/10 per cent Blood was present in all specimens The urine was normal diastase 10 units Serum calcium 5 7 mg per 100 c cm , blood phosphorus, 1 5 mg per 100 c cm , van den Bergh (indirect reaction), 1 2 units

The Wassermann reaction was negative Blood examination erythrocytes, 4,100 000 per c mm haemoglobin 76 per cent , colour index, 0 9 (June 24) leucocytes, 4,500 per c mm , polymorphs 83 per cent , lymphocytes, 12 per cent , mononuclears, 5 per cent (July 12)

X-Ray Examination—Barium meal showed a normal stomach and duodenum Barium enema revealed a distended large bowel but no other abnormality A diagnosis of idiopathic steatorrhoea was made

Treatment—The patient was treated with fluids to overcome dehydration and was placed on a low fat diet including fruit and salads Radiostoleum and liver extract (1/2 lb daily) were administered Under this regime the diarrhoea improved and the patient gained 9 lb in weight On August 1 the total faecal fat figure was 43 per cent , neutral fat 18 9 per cent , fatty acids and soaps, 24 1 per cent On August 9 the serum calcium figure was 8 7 mg per 100 c cm The erythrocytes numbered 4 000 000 per c mm , the haemoglobin percentage was 80 the leucocyte figure was 4 000 per c mm (September 3) The patient was finally discharged on September 7

SECOND ADMISSION

On February 19 1936 the patient was admitted to the Hospital for Tropical Diseases with severe diarrhoea and tetany He stated that under the treatment outlined he had remained reasonably well until a few weeks previously when diarrhoea and other symptoms had returned There were periodic attacks of diarrhoea lasting a few days, followed by intervals of improvement when the stools were soft but formed , at such times he felt fit During the attacks the bowels acted four to six times a day commencing in the early morning The stools were pale extremely loose, and very offensive they contained a little mucus Nausea was often present but he only vomited occasionally Pain was localized to the lower abdomen , it was dull and aching in character, and definitely related to attacks of diarrhoea Fever was absent

Physical Examination—The patient was profoundly emaciated and dehydrated Subcutaneous haemorrhages were present The tongue was clean red and dry but there were no sores or ulcers The lower teeth were very septic The abdominal parietes were thinned , the abdomen was markedly distended especially in the suprapubic and peri umbilical region Tenderness was not elicited, but a 'doughy feeling' was imparted on palpation No enlargement of the liver or spleen was detected, and the intra abdominal glands were not palpated No abnormality was noted in the cardiovascular or respiratory system The blood pressure was 110/80 The temperature on admission was 97° F , the pulse 96 and the respiration rate 24 No enlargement of the lymphatic glands was noted Trousseau's sign was elicited when taking the blood pressure but examination of the central nervous system revealed no other abnormality Recurrent attacks of tetany proved troublesome The urine was normal in all respects

Faeces—The stools were bulky pale and pasty, showing fatty acid crystals No ova or protozoa were found The total fat figure was 66 5 per cent fatty acids 41 2 per cent , neutral fat 25 3 per cent , split fat, 61 9 per cent , and unsplit fat 38 1 per cent

Blood Chemistry—The van den Bergh test showed bilirubin 1 5 units (indirect reaction) The serum calcium figure was 5 mg per 100 c cm inorganic phosphorus 2 5 mg per 100 c cm and the blood urea, 60 mg per 100 c cm

Blood Count—The erythrocyte count was 3,600 000 per c mm , the haemoglobin, 74 per cent colour index 1 per cent , and the average diameter of the corpuscles was 7 64 microns The red cells showed anisocytosis poikilocytosis, and basophilic stippling normoblasts and occasional megalocytes were seen The leucocytes numbered 5 000 per c mm ; the neutrophils 55 per cent the lymphocytes 36 per cent , the mononuclears, 8 per cent , and the basophils, 1 per cent

Treatment—The patient was treated by intravenous injections of 50 grammes of glucose in 2 pints of saline, and 10 units of insulin , 12 c cm of campolon was given intramuscularly also six radiostoleum tablets and 120 grains of calcium lactate daily The diet consisted of a defatted milk powder (sprulac) orange juice and marmite Since severe paroxysms of tetany continued, the patient was given 20 c cm of a 10 per cent solution of calcium gluconate intravenously, and 20 units of parathormone The temperature rose to 100° F the pulse to 112, and the respirations to 24 Death occurred at 5 45 p m on February 22 A necropsy was performed three and three quarter hours later

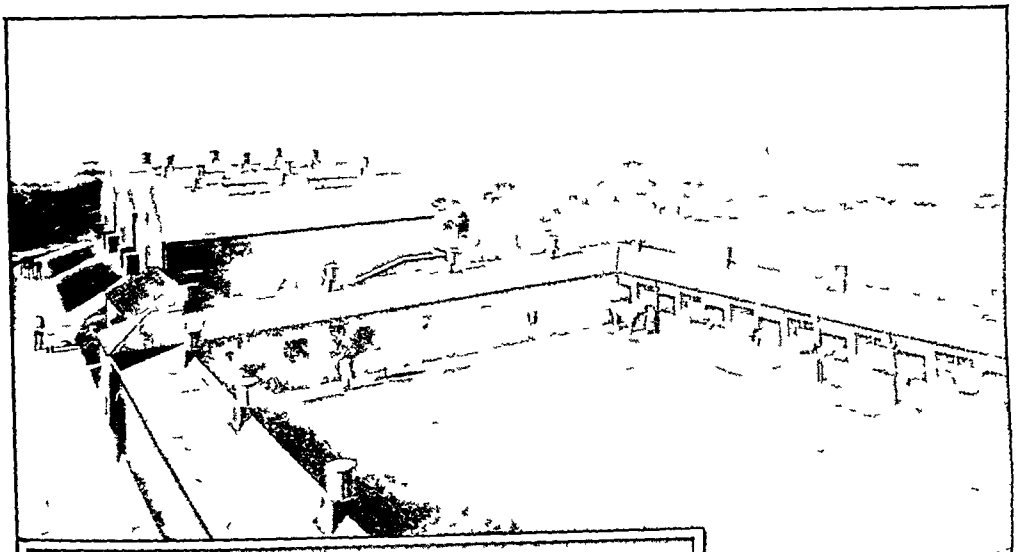
POST-MORTEM EXAMINATION

The body was emaciated and still warm rigor mortis had not set in The hands were cyanosed, and the fingers were in typical carpal spasm Some petechial haemorrhages were present on the legs The abdomen was protuberant, central distension being marked particularly in the suprapubic and peri umbilical region

Thorax—The right lung was bound down to the chest wall and base of the diaphragm by dense adhesions while the left lung showed some scarring at the left apex Congestion, oedema and anthracosis were present in both lungs There was no enlargement of the mediastinal lymphatic glands The heart muscle was of a dark reddish brown colour, microscopical section showed brown atrophy There was atheroma of the aorta, with some calcification at the orifice of the right branch of the coronary artery

Abdomen—A small amount of yellow fluid was found in the peritoneal cavity The coils of small intestine were distended The mesentery was oedematous and studded with numerous firm mesenteric glands, some small some markedly enlarged, ranging in size from 1 mm to 1 inch in their longest diameters (see Plate) None were softened or caseated and they appeared limited mainly to the mesentery of the small intestine, though the caecal and colonic glands were involved to a lesser degree The gall bladder was dilated no enlarged glands were found in the portal fissure, nor were the lymph glands draining the stomach perceptibly enlarged The mesentery itself was oedematous, and dilated lymphatics were very evident microscopically

The Alimentary Tract—The tongue presented a degree of smoothness suggesting papillary atrophy The oesophagus was normal The stomach showed patchy congestion and some haemorrhages into its mucosa, while the first four inches of the duodenum presented a 'sago grain-like appearance which microscopical examination revealed to be due to clumps of Brunner's glands No definite ulceration was present One small nodule located in the submucosa was removed for section three inches from the pylorus Section showed a vein containing a blood clot which had probably ruptured a short time before death In the jejunum there were patches of congestion, a few petechiae, and prominent valvulae conniventes the walls in places, appeared dilated and thinned, but this was probably only part of the general atrophy No ulcers were noted Similar changes were present in the ileum The caecum was congested There was a long kinked appendix extending over the pelvic brim to the left side which contained concretions resembling date stones The descending colon was filled with putty like faeces The mucous membrane appeared thickened, and here and there patches of milky-white appearance and pink streaks were noted extending over several square inches Microscopically some thickening and increased fibrosis of the submucosal layer of the descending colon was found



The Abdominal Organs—The liver was small (weight 1 [illegible] grammes), and normal in colour and consistency The gall

Evans Sons Lescher & Webb Ltd.
LIVERPOOL and LONDON

bladder was distended with thick tarry bile The spleen also was small (weight 135 grammes) and normal in all respects Some enlarged glands were noted in relation to the pancreas The right kidney weighed 210 grammes and the left 165 grammes both contained numerous retention cysts but the capsules stripped readily and the cortex was of good width The pyramids were congested The bladder and prostate were normal

Lymph Glands—No lymphatic glandular enlargement occurred elsewhere than stated

Endocrine Glands—The thyroid appeared small and the testicles atrophic The parathyroids (two dissected out) suprarenals and pituitary appeared normal and showed no change on microscopical section

Brain—No abnormality was seen

Bone marrow was obtained from the ribs Microscopical sections and smears revealed a normoblastic type

Microscopical Picture—An extensive microscopical examination of the lymph glands of the mesentery was made but apart from hyperplasia of lymphoid elements and some increased fibrosis in the mesenteric glands no abnormalities were found The lymph nodes were present and their normal architecture was preserved A diagnosis of lymphoma was made on histological grounds

Comment

The case was one of very great interest, since a condition of hyperplasia of the mesenteric lymph glands classified as lymphoma and associated with lacteal obstruction had led to steatorrhoea tetany extreme wasting abdominal distension and the typical sprue abdomen The patient was too ill for the glucose tolerance test but the combination of a high faecal fat (55–66 5 per cent) which was adequately split the low serum calcium (5 7–5 mg per 100 c cm) and a low or normal inorganic blood phosphorus (1 5–2 5 mg per 100 c cm) is typical of defective absorption The anaemia was of normocytic type and not severe

Case II

A married woman aged 42 was born in England and went to the Federated Malay States in 1920 She remained there until 1930 when she returned to England permanently There was a history of four miscarriages and two healthy children *B coli* cystitis occurred in 1923 and recurred in 1928 In 1929 she was operated on for uterine prolapse cellulitis of the leg occurred in the same year

Present Illness—For the previous few years she had been feeling below par and losing weight and about a year before admission to hospital began to be troubled with nausea vomiting abdominal distension and flatulence She had lost 2 st in weight during the previous year In March 1933 there was an attack of diarrhoea lasting a fortnight Blood was absent from the stools Nausea and vomiting continued and since subacute intestinal obstruction of the small bowel was suspected she was admitted to the hospital and operated on by Mr F Wilson Harlow who reported that adhesions and kinking of the lower ileum were found caused by numerous enlarged glands in the mesentery of the small gut to which it was adherent The adhesions were freed and the involved gut was straightened out At the operation numerous enlarged glands were noted in the mesentery of the small intestine ranging from the size of an almond to that of a duck's egg The lymphatics of the small gut were enlarged and stood out like a specially injected museum specimen The ascending transverse and first part of the descending colon were about three times the normal size resembling Hirschsprung's disease An effort was made to remove one of the large glands but it ruptured and several cubic centimetres of milky fluid escaped A second gland was subsequently excised and fluid which filled a test tube was removed This was examined for filarial embryos and since abdominal filariasis was suspected the patient was subsequently removed to the Hospital for Tropical Diseases for further investigation

Physical Examination—The patient was emaciated the skin dry and atrophic and the mucous membrane somewhat pale there were some hard enlarged glands in the groin The tongue bore a distinct resemblance to that seen in sprue being raw in its anterior half especially along the edges the papillae were not prominent The abdomen was distended and the abdominal wall very thin visible peristalsis was present There was tenderness in both left and right iliac fossae but no abnormal mass could be palpated Neither the liver nor the spleen was demonstrably enlarged Knee jerks and ankle jerks were absent but no other abnormality was noted in the central nervous system

LABORATORY INVESTIGATIONS

The intradermal test for filariasis was negative

Haematology—The erythrocytes numbered 4 240 000 per c mm The haemoglobin percentage was 80 the colour index was 0 94 the average diameter of the corpuscles was 7 64 microns A mild anaemia normocytic in type was present No filarial parasites were found in the day or night blood The leucocyte count was 16 000 per c mm neutrophils 83 per cent lymphocytes 15 per cent and mononuclears 2 per cent

Serology—The Wassermann and the filarial complement fixation reactions were negative

Blood Analysis—The bilirubin content of the plasma was normal The blood calcium content was 10 mg per 100 c cm and that of the blood phosphorus 3 3 mg per 100 c cm

Faeces—These were negative for ova protozoa and acid fast bacilli The stools were pale and acid in reaction they showed soap plaques but no cellular exudate The total fat percentage was 75 3 and that of the neutral fat 54 1 The figure for fatty acids was 21 2 per cent thus only 28 2 per cent of the fat was split

Urine—This had a neutral reaction and the specific gravity was 1010 there was a trace of albumin The centrifuged deposit contained numerous leucocytes and epithelial cells a culture produced *B coli* The diastase content was 10 units the twenty four hourly volume was 1 490 c cm and the total output was 14 900 units

Fractional Test Meal—There was a normal fasting juice a high secretion of HCl a maximum of 55 c cm N/10 per cent being found at one and three quarter hours Some delay in the emptying was noted as judged by the starch reaction

Glucose Tolerance Curve—This was of the flat type and showed a maximal rise of only 17 mg per 100 c cm at one and a half hours (Chart 1)

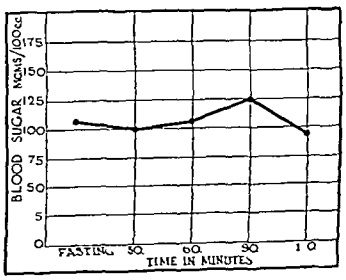

CHART 1—Case II Oral glucose tolerance curve in case of mesenteric lymphadenoma

A radiograph of the chest failed to reveal enlargement of the thoracic glands

Biopsy of the Gland—Microscopical examination of an inguinal gland showed typical Hodgkin's disease

Comment

Many features suggested tropical sprue the sore tongue the loss of weight and the distended abdomen with its atonic wasted parietes and visible peristalsis are found in this condition Diarrhoea was not a con-

Where Food tolerance is essential . . .

EXTREME palatability and lively stimulation of the gastric juices make Brand's Essence a reliable restorer of food tolerance and digestive harmony—even when appetite is weakest. At no stage is the process of digestion retarded by precipitated solids, and the protein content of the Essence is always capable of absorbing free acid to an extent which prohibits any excess.

BRAND'S CHICKEN OR BEEF ESSENCE

is never contra-indicated

BRAND & CO LTD, SOUTH LAMBETH ROAD, LONDON, S W 8

spicuous feature, though bouts of it occurred from time to time, and while in hospital the patient was passing from one to four stools daily, these contained a great excess of fat (75·3 per cent) which was inadequately split. The finding of a normal serum calcium is of interest. Most of the excess faecal fat was present as neutral fat and not as fatty acids, and perhaps this was the reason why there had been no undue interference with the absorption of calcium. On the other hand, there was a flat type of glucose curve with a delayed maximal rise of only 17 mg. per 100 c.cm., similar to that encountered in sprue and idiopathic steatorrhoea.

Case III

A married woman aged 32 had suffered from malaria in 1931, shortly after her return to India in September, 1933, she had passed frequent, very loose, pale stools associated with abdominal flatulence and discomfort. She did not complain of cramps or tetany. The tongue never felt sore but was unduly red around the edges. Later there was a *B. coli* infection of the urinary tract.

First Admission

On admission to the Hospital for Tropical Diseases, London, on April 20, 1934, the patient had a sallow complexion and a clean, moist tongue. The abdominal parietes were atrophic, and on palpation a "doughy feeling" was imparted to the examining fingers. Although the pressure of bedclothes caused discomfort to the limbs and there was numbness of the legs and feet there were no abnormal signs indicating involvement of the central nervous system.

Laboratory Examinations

Blood.—The erythrocytes numbered 4,720,000 per c.mm. The haemoglobin percentage was 80, and the colour index 0·85. The average diameter of the corpuscles was 7·32 microns. The leucocyte count was 12,000 per c.mm.: neutrophils, 65 per cent., lymphocytes, 29 per cent., and mononuclear cells, 6 per cent.

Faeces.—The pale semi-formed stools were slightly acid to litmus, and contained fatty acid crystals. The total fat percentage was 30, and that for neutral fat 14. The figure for fatty acids was 16 per cent., for split fat 54·8 per cent., and for unsplit fat 45·2 per cent.

Urinary Examination.—The urine contained a few leucocytes and squamous epithelial cells. A culture was negative for *B. coli*.

Fractional Test Meal (April 21, 1934).—The fasting gastric juice amounted to 40 c.cm., it contained no free acid. There was hypochlorhydria, the maximal rise of HCl being 10 c.cm. N/10 per cent. at two hours. There was a slight response to histamine.

Glucose Tolerance Test.—The graph was practically a straight line, the maximal rise of 10 mg. occurring at one and a half hours (Chart 2).

The history and clinical features, the excess of fat in the stools, the hypochlorhydria, and the flat type of glucose tolerance curve suggested a diagnosis of tropical sprue and the patient was treated accordingly. She received a high protein dietary, acid hydrochlor. dil. *B.P.* (1 drachm t.d.s. p.c.), and four tubes of liver extract (the equivalent of 1 lb. whole liver) daily. Under this regime the symptoms ameliorated, the flatulence and abdominal distension disappeared, and the discomfort and numbness of the legs greatly improved. There was also an improvement in the glucose tolerance but the fat content of the stools and the blood counts remained stationary.

Later Laboratory Examinations

On May 15 before her discharge, the findings were as follows:

Glucose Tolerance Curve.—The maximal rise at one and a half hours was now 33 mg. per 100 c.cm., instead of 10 mg. on April 25 (Chart 2).

Fat analysis showed total fat, 32·5 per cent.: neutral fat, 7·7 per cent., fatty acids, 24·8 per cent., split fat, 76·2 per cent., and unsplit fat, 23·8 per cent.

Blood Examination.—The red cells numbered 4,420,000 per c.mm., the haemoglobin percentage was 80, the colour index 0·9, and the average diameter of corpuscles, 7·48 microns.

The patient was discharged from hospital feeling well on May 26. At no time had there been any rise in temperature.

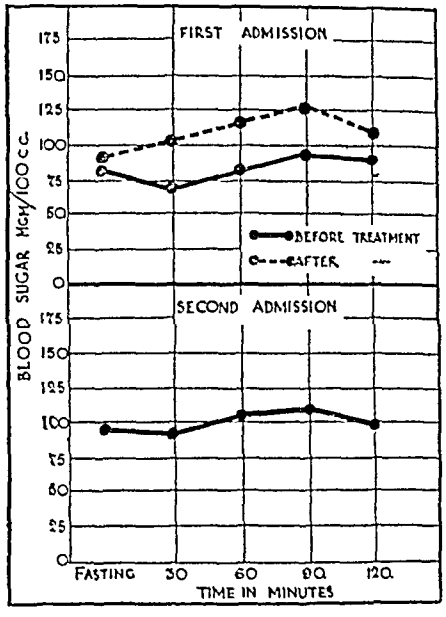

Chart 2.—Case III. Oral glucose tolerance curves in case of mesenteric lymphosarcoma.

Second Admission

Three months later, on August 27, she was readmitted to hospital with a temperature of 100·4° F.; the pulse rate was 102 and the respiration rate 24. She looked pale and ill, the abdomen was now somewhat distended and on examination yielded a doughy sensation to the palpating fingers. She had kept quite well since discharge from hospital until two weeks previously, when diarrhoea with pale, watery, frothy stools, flatulence, and loss of appetite commenced, vomiting ensued. There was some enlargement of the axillary and inguinal glands, a mass of possible mesenteric glands was palpable in the lower abdomen centrally.

Laboratory Investigations

Blood Examination.—The red cell count was 4,400,000 per c.mm., the haemoglobin 85 per cent., the colour index 0·9, and the average diameter of corpuscles was 7·48 microns. The leucocyte count was 10,000 per c.mm.: neutrophils 72 per cent., lymphocytes 22 per cent., and mononuclears, 6 per cent. The red cells showed some anisocytosis.

The *urine* was normal, cultures proved sterile.

The *stools* were very pale and of liquid consistency, with an acid reaction to litmus. Numerous fatty acid crystals were present. The total fat figure was 43 per cent.: fatty acids 30·5 per cent., neutral fat, 12·5 per cent., split fat, 71 per cent., and unsplit fat, 29 per cent.

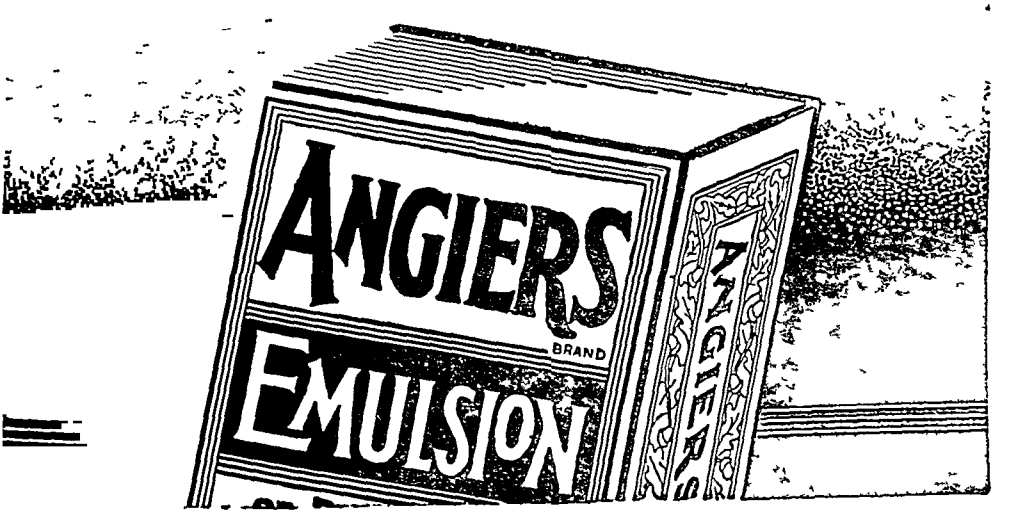
Glucose Tolerance Test.—This was performed on August 30 and showed a flat type of curve with a maximum rise of only 13 mg. at one and a half hours (Chart 2).

Biopsy of Skin Nodule.—Section of a nodule in the skin which had been removed under local anaesthesia showed considerable infiltration of the dermis with lymphoid cells showing active mitosis. The microscopical picture suggested lymphosarcoma, though Hodgkin's disease could not with certainty be excluded.

X-ray examination of the thorax and abdomen revealed no abnormality.

The patient was given a high protein dietary (sprue) with acid hydrochlor. dil. *B.P.* after meals, but on this occasion

In Convalescence after Influenza, Pleurisy, Pneumonia, Bronchitis



The soothing, inflammation-allaying properties of Angiers Brand Emulsion and its general tonic effects especially commend its use in convalescence from acute respiratory affections It will clear up any remaining catarrh, whether of the respiratory or digestive organs It will restore tone to the digestive functions, and greatly improve assimilation and nutrition

An absolutely perfect emulsion, it is presented in a form pleasing to the taste, and acceptable to the most fastidious Moreover, it can be administered to advantage in conjunction with other remedies, such as salol, aspirin, bismuth, etc

'Angiers' is made with petroleum specially purified for internal use It is the original petroleum emulsion, the result of many years of careful research and experiment

Free Samples to the Medical Profession

THE ANGIER CHEMICAL COMPANY, LIMITED
(Dept B 5), 86, CLERKENWELL ROAD, LONDON, E C 1

she failed to improve Subconjunctival oedema was noted on September 14 and vomiting and anorexia became troublesome on October 2 Ten days later the patient became collapsed cyanosed and comatose, and died the next day

Comment

Features of interest in this case are (1) the presence of a clinical syndrome simulating sprue and associated with a palpable mass of ? abdominal lymph glands, and a skin nodule which histological investigation suggested lymphosarcoma, (2) the associated steatorrhoea and flat glucose tolerance curves (3) a remission of symptoms for a period of three months and (4) the pyrexial relapse, which terminated fatally and which is a feature of abdominal lymphosarcoma though not of uncomplicated sprue The anaemia was mild and of normocytic type Permission was not granted for a necropsy, so the exact distribution of the glandular involvement was not determined

We recently saw another case of lymphoma, associated in this instance with steatorrhoea and profound megalocytic anaemia, in consultation with Dr Adolphe Abrahams and Dr R J V Pulvertaft at the Westminster Hospital

Case IV

A man aged 60 was admitted to the Westminster Hospital on November 18 1935 under Dr Adolphe Abrahams with anaemia loss of weight (27 lb) and diarrhoea characterized by pale yellow frothy stools He had previously suffered from malaria and amoebic dysentery and since he had resided in Ceylon for many years tropical sprue was suspected

Onset—Enlargement of the groin glands had been noted in the summer of 1934 and in November while in Tangiers, diarrhoea and fever had commenced Hodgkin's disease was diagnosed

Physical Examination—The tongue was smooth and fissured dental caries and pyorrhoea were noted There was pallor of the mucous membranes a greyish discoloured skin and marked bilateral enlargement of the inguinal femoral and axillary glands The glands were soft and discrete and some of the groin glands were the size of an almond Wasting was present The abdomen was distended and hyperresonant and the abdominal veins were dilated The central nervous system was normal

LABORATORY EXAMINATION

The erythrocyte count was 990 000 per c mm the haemoglobin percentage 25 the colour index 1 3 and the average diameter of the corpuscles 8 4 microns The leucocytes numbered 3 200 per c mm neutrophils 56 per cent. lymphocytes, 36 per cent eosinophils 3 per cent monocytes, 2 per cent and myelocytes 1 per cent

Faeces—The percentage of neutral fat was 5 4 of fatty acids 29 7 of soaps 16 4 and of total fat 51 5 Fatty acid crystals and striated muscle fibre were noted microscopically

A section of a gland removed at biopsy revealed a generalized lymphoid hyperplasia

Progress Notes—Liver injections and four blood transfusions were given By January 1 1936 the blood counts were as follows erythrocytes 2 150 000 per c mm haemoglobin 55 per cent and the colour index 1 3 The leucocytes numbered 5 400 per c mm polymorphs 51 per cent lymphocytes 37 per cent eosinophils 11 per cent and hyalines 1 per cent After January 2 a series of campolon injections 6 c cm daily and a high protein low fat, low carbohydrate type of diet were instituted Rapid progress followed Some oedema of the legs was noted on January 13 but this improved later By January 17 the red cells had risen to 4 000 000 per c mm and the haemoglobin percentage to 85 The colour index was 1 06 and the leucocytes numbered 10 000 per c mm

The patient became practically well and went home on February 3 He proceeded to Scotland, later relapsed badly, and in July was treated by Dr Forest Smith with a fat reduced diet calcium radiostoleum marmite per os and injections of hepastab A satisfactory haematological response again followed, the red cells rising from 1 400 000 to 4 100 000 per c mm and the haemoglobin from 36 to 78 per cent At the moment the patient is receiving hepastab injections (4 c cm monthly) and appears well but glands the size of a cherry are present on both sides of the neck in the groins and one axilla

Comment

Since this patient had resided in Ceylon the possibility remains that the condition is one of lymphoma and intercurrent tropical sprue On the other hand the glandular enlargement definitely preceded the onset of diarrhoea by several months which suggests, in view of the cases cited above, that mesenteric gland involvement is the basis of the syndrome The case differs from the other three in presenting a frankly megalocytic type of anaemia and this may be due either to additional involvement of the gastric and duodenal lymph nodes with defective production of Castle's intrinsic factor or to defective absorption of p a factor in the intestine The diagnosis however cannot be regarded as finally settled and the history is recorded with a view to stimulating further investigation in cases of this type

General Discussion

The exact histological diagnosis of glandular lymphatic enlargement is frequently unsatisfactory and pathologists themselves often express different opinions on the same section In Cases I and IV hyperplasia of the cellular elements associated with some degree of fibrosis was found, since the lymph nodes were present and their normal architecture was preserved the condition was classified as lymphoma though some would diagnose lymphosarcoma Case II was definitely one of Hodgkin's disease, but in Case III some doubt remained as to whether the disease was lymphosarcoma or atypical Hodgkin's disease This paper however is not concerned with the minutiae of histological diagnosis but rather with a group of adenopathies involving the mesenteric lymph glands resulting in lymphatic obstruction malabsorption of fundamental food elements and the production of a sprue like syndrome with death in three of the four cases reported In both instances where it was possible to examine directly the mesenteric lymph nodes enlarged glands associated with stasis and dilatation of the afferent lymphatics were demonstrated

Lymph stasis would naturally result in defective absorption of fat since the mesenteric lymphatics constitute the route through which fat normally reaches the circulation Steatorrhoea and malnutrition would follow Presumably also the absorption of fat soluble vitamins such as A and D might likewise be interfered with and failure of the latter vitamin to reach the tissues in sufficient concentration might well underlie the severe degree of hypocalcaemia and tetany noted in Case I In this instance there was a proved excess of free fatty acids in the stools and these by uniting with calcium to form insoluble soaps would further decrease the availability of ingested calcium for absorption Similarly the flat types of oral glucose tolerance curves noted in Cases II and III are to be interpreted in terms of defective absorption of carbohydrate

Similar curves are found in tropical sprue idiopathic steatorrhoea and coeliac disease Fairley (1936) in tropical sprue and Ross (1936a) in coeliac disease have recently shown in contradistinction to the results of Thaysen (1929) that flat oral curves are associated with decreased and not increased glucose tolerance, and that they originate from defective absorption of glucose in the

The Satisfactory Contraceptive

In all cases where physiological conditions are normal, Ortho-Gynol may be recommended with confidence

Ortho-Gynol is dependable while at the same time æsthetically acceptable in the majority of cases

From the moment of application Ortho-Gynol is effective and it is proof against deterioration even in tropical climates for relatively long periods

For the maximum convenience, Ortho-Gynol is available in the economical bulk tube illustrated This contains sufficient for 15-20 applications, and is sold complete with unbreakable Applicator for 5/- A refill of the same size, without Applicator, costs 4/- Ortho-Gynol is also available in its original packing of 6 complete units each with disposable nozzle for 4/6

For a clinical sample, you are invited to communicate with

Johnson & Johnson (GT BRITAIN) LIMITED

SLOUGH, BUCKS

gut and not from its excessively rapid utilization by the tissues In three children with tabes mesenterica Ross (1936b) also found oral curves of a flat type associated with intravenous curves of high type, and concluded that defective absorption of carbohydrate was responsible for the decreased glucose tolerance manifested by these patients In the present series of cases the glucose tolerance following the intravenous injection of glucose was not determined, but in the steatorrhoeas flat oral glucose curves are often found in association with high faecal fat, and it is evident that defective absorption of both glucose and fat frequently occur together Verzár (1936) has recently shown that phosphorylation controls the absorption of both fatty acids and glucose in the cells of the intestinal mucosa Perhaps under the conditions of intestinal lymph stasis described in this paper the phosphorylation process is defective, and lowering of the absorption gradient for both these substances results

Conclusions

1 A sprue-like syndrome associated with lymphoma, lymphadenoma, and lymphosarcoma of the mesenteric lymph glands is recorded in adults

2 Steatorrhoea was present in all four patients, one of whom died with severe tetany and hypocalcaemia

3 Flat oral glucose tolerance curves similar to those encountered in sprue were found in both cases investigated from this viewpoint

4 It is suggested that defective intestinal absorption resulting from lymphatic obstruction is responsible for the biochemical and clinical findings recorded above

We wish to acknowledge our indebtedness to Dr Adolphe Abrahams, Dr R J V Pulvertaft, Dr Forest Smith Mr F Wilson Harlow, and Dr G H Garnett for supplying the detailed clinical and pathological data included in certain of the case histories

Mary Gover (*Publ Hlth Rep Wash*, October 9, 1936, p 1399) states that six of the seventeen years since the summer of 1919 have failed to show more than the seasonal expectancy of deaths from influenza and pneumonia During the other eleven years recognizable outbreaks of influenza have occurred Mortality in about ninety-five cities scattered throughout the United States shows that the total excess mortality in these epidemics has varied from 99 3 per 100,000 from influenza and pneumonia in 1919–20 to 5 4 per 100 000 in the winter of 1934–5 In the winter of 1935–6 there were two periods of high mortality—namely, from December 20 to January 18 and from February 9 to May 2 The reported cases in forty-four States and New York City roughly paralleled the curve of mortality for 1935–6 From December 29 to May 2 there were 121,011 cases of influenza reported, an excess of 78,213 cases over the number reported in the corresponding period for 1934 while the incidence of influenza was low The epidemic of 1936 started in the West South Central section and spread through the Southern States to the east coast In both the West and East South Central areas mortality from influenza and pneumonia continued well above the normal expectancy from December 1935, to the first part of May 1936 It did not, however, reach extreme proportions in any section

TREATMENT OF MINOR BURNS BY AMYL SALICYLATE AND OTHER SALICYL ESTERS*

BY

R. LESLIE STEWART, M.B., F.R.C.S Ed

Assistant Surgeon, Edinburgh Royal Infirmary

(WITH SPECIAL PLATE)

Injuries due to burns and scalds may be divided into two main classes (*a*) severe and extensive injuries, where life is endangered by shock and the onset of acute toxaemia, (*b*) less extensive injuries, in which the problem of acute toxaemia does not arise Cases within the former category need urgent admission to hospital, and the injuries should be treated with tannic acid cases within the latter category are commonly met with in hospital out patient departments, and it is solely with these that this paper deals In treating these less extensive injuries one should aim at employing methods which so far as possible satisfy the following criteria (1) simplicity of application and infrequent changing of dressings, (2) alleviation of pain, (3) control or eradication of sepsis, (4) minimal over growth of granulation tissue on raw surfaces, (5) absence of local or general skin irritation and dermatitis, (6) relatively rapid and sound healing without contractures For hospital practice, with a constantly changing staff of nurses and dressers, it has been difficult to standardize a sufficiently simple technique, and even when this is attained the results are prone to be upset by the patients themselves, often through a desire to return to work too early, or from unsatisfactory home surroundings and lack of personal cleanliness For these reasons one cannot but expect occasional disappointments in patients who otherwise should have done well

At the invitation of the Therapeutic Trials Committee of the Medical Research Council, and through the courtesy of Sir David Wilkie, I have during the last four years carried out an extensive series of clinical tests on the efficacy of certain salicyl esters in the treatment of burns and scalds, all the work being done in the surgical out patient department of the Edinburgh Royal Infirmary Various esters have been tested and some hundreds of cases have been treated, as it was considered that little importance could be attached to the results obtained in a small number of experiments

The circumstances which led to the investigation are of some interest Salicyl esters, notably methyl salicylate and butyl salicylate, have long been known to have analgesic properties, and amyl salicylate itself was introduced in London as a treatment for burns by Messrs Strange and Graham (chemists) many years ago It was tried at Guy's Hospital, but its use was abandoned on account of its smell This has since been made somewhat less disagreeable by greater purification, and a member of the staff of Messrs Spencer, Chapman, and Messel, Ltd, heavy acid manufacturers, of Silvertown having heard of the analgesic properties of the ester, tried it in minor acid burns His firm were so impressed with the healing obtained in the first few cases that they communicated the news to other firms, one of which (Messrs A Boake, Roberts and Co, Ltd) applied to the Medical Research Council for further information as to the safety and utility of the treatment The Council's Therapeutic

* A report to the Therapeutic Trials Committee of the Medical Research Council From the Department of Surgery University of Edinburgh

the covering with elastic adhesive bandage is then necessary to relieve discomfort The combination of a massive dose of ultra violet rays and elastic adhesive bandage causes a cleaner granulating surface and rapid healing Varicose eczema surrounding the ulcer area responds favourably to ultra violet irradiation General observation indicates that ultra violet rays accentuate the successful result produced by the adhesive bandage

At the final stages of healing the elastic bandage may be discarded and a milder dose of ultra violet rays applied to the skin of the whole leg and foot—for example exposure at a distance of 20 inches to the air cooled quartz mercury vapour lamp for five minutes The patient is told to bathe the limb daily in warm alkaline water warm water and oatmeal being suitable The limb having been dried olive or almond oil is applied

Varicose veins associated with varicose ulcers must be treated by means of injection of a sclerosing solution whenever possible Varicose ulcer is likely to recur if varicose veins are not so treated Those cases in which old age ill health or the size of the veins renders injection treatment unsuitable require an elastic stocking after the ulcer has been healed In cases of varicose ulcer associated with recurrent attacks of thrombophlebitis oedema swelling and vasomotor changes symptoms of an obstructed circulation may be seen Such cases require ultra-violet irradiation of the skin of the legs combined with infra red and luminous irradiation This treatment is applied once or twice a week for about two or three months until signs of oedema and other signs and symptoms of obstruction of circulation have disappeared

Varicose Eczema

Varicose eczema is difficult to heal Localized patches situated over the skin area of the internal or external malleolus often foreshadow varicose ulceration Varicose eczema is often associated with phlebitis and other circulatory complications due to varicose veins Secondary infection by the common pyogenic bacteria causes a spreading and acute infiltrative or exudative dermatitis Intermittent attacks of cellulitis or septic thrombophlebitis cause severe complication Chronic fibrosis pigmentation oedema and hypertrophic sclerosis of the skin covering a tortuous mass of varicose veins offer a typical clinical picture, there is often a history of fifteen to twenty years disability

In these cases of varicose eczema the reaction of the skin to ultra violet light rays is of particular interest During the phase in which the skin is bright red, showing areas of exfoliation and inflammatory oedema, the skin is tolerant to radiation and four to six normal erythema doses may be applied without undue reaction However, when the skin is pale or pigmented by thickened hypertrophic sclerosis the area of scar tissue is tolerant to radiation but the surrounding skin is often extremely sensitive and a normal erythema dose will then cause an intensive reaction which will prove of great discomfort to the patient Ultra violet rays must then be applied with caution The capillary circulation of the skin is often disturbed and thrombosis of varicose veins may cause an area of obliteration and ischaemia or necrosis of the skin approaching ulceration may result Other irregularities of circulation and secondary infection cause acute and chronic inflammation Since the local application of ultra violet rays to the skin augments the capillary circulation and stimulates growth of epithelial cells it is of great value in healing varicose eczema

The technique is similar to that applied in the treatment of varicose ulceration There is an intensive exposure to ultra violet rays, equivalent to six normal skin erythema doses, to localized patches of eczema and the normal skin for half an inch surrounding each zone is also irradiated Elastic adhesive bandage is then applied to the whole foot and leg and left undisturbed for one week The ultra violet irradiation causes an active inflammatory reaction, followed by oedema, blistering and finally exfoliation of the skin Bandaging the limb with adhesive strapping and thus keeping the treated lesion covered gives relief to the patient as the painful symptoms following intensive ultra violet irradiation are thereby diminished Healing of the skin gradually takes place and week by week steady improvement may be recorded The treatment is repeated once a week for about six to eight weeks, by this time healing is well advanced

At this stage the varicose veins should be treated by weekly injections of sclerosing solutions The local intensive irradiation is stopped and the skin of the anterior or posterior surface of the whole leg is exposed to the rays once a week at a distance of thirty inches for five minutes using the quartz air cooled mercury vapour lamp, this is equivalent to two normal skin erythema doses The limb is bandaged as before The object of this treatment is to stimulate the capillary circulation and the epidermal cells of the skin of the leg It greatly relieves the circulatory disturbance caused by varicose veins and gives much relief to the patient At the final stages of healing bandages are discarded and the limb is daily bathed in tepid mildly alkaline water, and olive or almond oil is applied

The Treatment of Varicose Veins

Although the modern treatment by sclerosing solution has greatly benefited many cases of varicose veins there are unfortunately some in which the enormous size of the veins or the general condition or health of the patient does not allow of this technique Many of the cases unsuitable for injection treatment get relief from agents which improve the skin and capillary circulation This explains the good results obtained at many of the clinics and spas which specialize in treatment of varicose veins phlebitis and its sequelae Exposure of the skin of the legs to erythema doses of ultra violet rays greatly relieves the symptoms in cases of old standing varicose veins The cases selected for such therapy were those in which (*a*) the health of the patient or (*b*) the enormous size of varicose veins did not permit treatment by injection of sclerosing solutions or by ligature Treatment was applied twice a week for eight weeks

Cases considered suitable for injection therapy were treated as follows The skin of the anterior or posterior surface of the leg was exposed to rays of the air cooled mercury vapour lamp at a distance of thirty inches for five minutes The alternative skin surfaces were irradiated each week The patient was next made to stand on a small stool about twenty four inches in height the operator sitting at a lower level on a stool about six inches high The veins were injected in order starting from below in the foot and working up the leg One single injection of 3 to 4 c.cm of a 10 per cent solution of sodium morrhuate (Parke Davis and Co Ltd) was made each week Directly after a successful intravenous injection had been made the patient sat down on a chair in such a way that the limb rested on the stool while the patient faced the operator During this procedure the operator kept a sterile swab moistened with 1 in 3 000 spirit and mercury biniodide on the site of the puncture An elastic adhesive bandage was then applied to the foot and leg This remained undisturbed for a week when the patient again reported for

treatment, the bandage was removed, and the treatment continued

On an average six to eight injections at weekly intervals are needed for successful treatment of varicose veins Roughly a length of four to six inches of vein is thrombosed by each weekly injection The result of this technique is invariably successful in suitably selected cases Failure to obliterate the varicose veins occurs when the width of the vein is too big for successful clotting Some of these cases are suitable for ligature high up in the leg or thigh, followed by injection with sclerosing solution

Complications may occur such as a sudden spreading thrombophlebitis passing along the course of the superficial saphenous vein of the whole leg, particularly in cases where there has been a history of previous attacks of phlebitis, and where there have been mild attacks of septic thrombophlebitis It is a wise precaution to warn such patients of the possibility of this trouble, suspicious cases are recognized with clinical experience The patients must rest in bed until the signs and symptoms of active inflammation have subsided Such cases spontaneously cure themselves of varicose veins, but treatment for restoration of a new collateral circulation is needed The only disadvantage of this technique is an economic one the drugs and dressings required are expensive, but as they cure chronic sufferers of varicose veins their cost is small compared with that involved by prolonged attendance at out-patient clinics for palliative treatment

There are old-standing varicose ulcers, some of over twenty years' duration, which are at times difficult to heal In some cases there is more ulcerated area than normal skin in the leg, and it is amazing how such patients have managed to work and carry on their lives and have retained their limb and survived

Treatment of Deep-seated Ulceration

In cases of deep-seated ulceration, perhaps of a small area but surrounded by extensive fibrosis adherent to the deeper tissues and fixed to underlying bone, it is difficult to restore adequate blood supply to stimulate granulation tissue and healing Errors in metabolism associated with advancing age, such as glycosuria, gout, and nephritis, may often add to these difficulties Some of these cases ultimately change in character and become malignant After efforts to heal the ulcers by ultra-violet irradiation and bandaging have made little progress other methods may be attempted The edge of the ulcer and fibrous tissue may be excised by means of surgical diathermy, or the whole base of the ulcer may be destroyed by diathermy fulguration Intensive doses of ultra-violet rays may now stimulate healing by augmenting the separation of a slough and exposing new vascular granulation tissue and epithelial cells Skin grafting is not successful unless a good and healthy bed of granulation tissue is available By these means these difficult and resistant cases may be encouraged to heal

During the past four to five years over 240 cases of varicose ulcers have been treated and over 90 per cent have been healed within six months Patients are asked to report afterwards for examination every two months, but some patients fail to do so and make conclusions difficult However recurrences of varicose ulcer fortunately have been few There was recurrence in eight cases, in each of which the patients failed to report for intervals as long as one to two years The results of early cases of varicose ulcer and varicose eczema are excellent, in some instances there is healing after three to four treatments The usual routine adopted includes the injection of varicose veins as soon as ulcer or eczema is healed The final results in cases of varicose veins are good Providing the cases are suitable over 95 per cent are cured The patients report afterwards at intervals of three to six months Observation of a series of cases, the number healed, and those unhealed, after a fixed period of time, conveys little information, for an early and healthy varicose ulcer may be healed in three weeks, while an old-standing septic ulcer may need constant supervision and treatment for many months It is difficult, if not impossible, to obtain a regular series of similar clinical types of cases suitable for critical statistical analysis The conclusion is reached that by the technique which has been described cases of varicose ulcer, varicose eczema, and varicose veins may be rapidly and permanently healed in an average period of four to six months The technique needs a regular routine and organized team work by nursing and medical staff

Clinical Memoranda

Fulminating Agranulocytosis

The following account of a case of fulminating agranulocytosis seems worthy of record

CASE REPORT

The patient was a married woman aged 66 Apart from recurrent attacks of mild bronchitis her health had been good, though she was a frail little woman weighing only 6 st odd On the day of onset she was well and able to carry out a day's shopping, towards evening she felt suddenly ill and shivery, and continued to shake all night I was sent for at 7 a m, and was greeted by the remark, "Doctor, I have never felt so poorly in my life", but apart from a temperature of 102 5° F there was little to be made out, the fauces were free from any exudate or hyperaemia In the evening the temperature was still sustained and the general condition was unchanged, there was a complaint of rawness behind the nose, making breathing painful The patient had a bad night, the pain behind the nose increased, and swallowing became painful By morning her condition was distressing though the temperature had fallen to 100° F and the pulse rate was slower I was dumbfounded to find a grey-black area of necrosis on both tonsils and immediately gave 24 000 units of anti diphtheritic serum and called in Dr F B Smith A leucocyte count was taken and also a swab of the throat, culture of the swab proved negative, and the leucocyte count showed only 360 white cells among which were no granular cells, though ten times the normal routine volume was used

A diagnosis of agranulocytic angina was made, and Dr Wilkinson of Manchester was called in consultation When he arrived at about 2 a m the patient's condition was pitiable, every breath or swallow causing distress though the temperature and pulse were now normal Dr Wilkinson agreed as to the diagnosis, and 40 c cm of pentose nucleotide was given intravenously, followed by 10 c cm every three hours and a further 20 c cm intramuscularly The pulse and temperature remained normal, but the patient gradually became comatose and died the same afternoon the pulse becoming irregular two hours before death

The total duration of the illness from the first clinical symptom was sixty-eight hours I should add that a further blood count was carried out at 10 a m on the last day, the count had then fallen to 130 cells, and again no granular cells were seen, though thirty times the normal volume of fluid was used It is of interest that the patient had been in the habit of taking cephos tablets, but an analysis of these showed no evidence of amidopyrine

Preston O K G GUYER.

Trials Committee agreed to arrange an investigation of the question, and the work was entrusted to me and my colleagues at Edinburgh Messrs A Boake, Roberts and Co, Ltd, are manufacturers of the salicyl esters, and have supplied large quantities of these substances for the tests They are also the makers in this country of 'abracide,' a liquid mixture of isomeric methyl tertiary butyl phenols, which has been found in suitable concentration to blend satisfactorily with amyl salicylate so as to produce a stable analgesic and antiseptic solution

Amyl Salicylate

In the first series of clinical tests amyl salicylate alone was used, and it was early apparent that this ester was definitely analgesic when applied to the raw surface of a burn or scald Very satisfactory healing was obtained in approximately two thirds of the cases treated, but in the remaining third, owing to the presence or onset of relatively mild local sepsis, healing was delayed and antiseptic dressings, such as flavine, had to be substituted This was not unexpected in view of the fact that laboratory tests had already demonstrated that amyl salicylate has little or no bactericidal power None of the patients showed evidence of salicylate poisoning or of general toxic absorption On the other hand, a certain amount of local skin irritation was seen, but in the light of our subsequent findings it seems probable that this was chiefly due to the unnecessary frequency with which the dressings were at first changed

Amyl Salicylate and Antiseptics

The next stage of the investigation was to treat a series of cases along the same lines but with the addition of an antiseptic to the amyl salicylate Various combinations were tried and tested bacteriologically before we decided to employ dichloramine T because this, unlike many other antiseptics, was found to be readily miscible with amyl salicylate and to give an almost clear solution when used in a concentration of 1 per cent in the ester The strength of the solution had later to be reduced by half, since several of the patients complained of considerable discomfort with the higher concentration of dichloramine-T

Approximately eighty cases of burns and scalds were treated with this mixture Healing progressed satisfactorily in 90 per cent of these but in the remainder some degree of sepsis occurred The results on the whole, were thus superior to those obtained with amyl salicylate alone but even with the dichloramine T at a strength of only 1/2 per cent the patients were apt to complain of more discomfort than hitherto, and a further serious disadvantage lay in the fact that the solution was unstable, it quickly lost much of its antiseptic value, and so had to be freshly prepared each day A certain degree of cutaneous irritation and desquamation continued to cause trouble On these grounds it was decided that the dichloramine T mixture was not satisfactory, and another series of tests was begun with amyl salicylate and abracide In addition to combining well with amyl salicylate abracide has been shown to possess good germicidal properties, and was claimed to be relatively non toxic and non irritating to the tissues

Fifty one cases of injuries from burns and scalds were treated employing a low concentration—namely 1 in 1,000 of 5 per cent abracide solution in amyl salicylate. Of these fifty one cases very satisfactory healing was obtained in thirty four, the average duration of the treatment being a little over a fortnight In fourteen cases there was somewhat delayed healing owing to slight sepsis and more active local infection was encountered in the remaining three patients, though the eventual results were satisfactory The longest period of active treatment in this group was sixty days In evaluating these results it should be noted that in certain instances the injuries had been sustained one to three days before the patients came to hospital, and especially in these, but also in some others infection was already present As in the previous series there was often considerable scaling and itching associated with cutaneous congestion even after the lesions had healed Three patients developed a dermatitis venenata which in one instance was quite severe All three had skin tests, and were found to be hypersensitive to amyl salicylate though not to salicylic acid No other symptoms indicative of either salicylate or phenol poisoning were met with in our patients

Benzyl and Methyl Salicylate

Especially in view of the extremely penetrating smell of amyl salicylate it was decided at this stage to test some other salicyl esters under the same conditions Benzyl salicylate and methyl salicylate were successively used, but apart from alteration and diminution of the odour emanating from the dressings they appeared to have no advantages over amyl salicylate The results, on the whole were inferior to those already obtained in regard to sepsis, cutaneous irritation was, if anything, more pronounced, while the analgesic properties of these esters appeared to be distinctly less Indeed where discomfort was specially complained of it was found that a change over to amyl salicylate sometimes gave immediate relief

For the above reasons it appeared that amyl salicylate was the ester of choice and we now set out to improve the technique of its use in order to decrease the incidence of infection and obviate if possible the occasional irritative dermatitis which seemed to synchronize with a somewhat exuberant growth of granulation tissue on the raw area of the burn or scald The concentration of abracide in the mixture was therefore increased to 1 in 10 000 (or 1 in 500 of the 5 per cent commercial solution) and the changing of the deep or surface dressings was reduced to a minimum As an outcome of these changes in the method of application our results showed a marked improvement and it is therefore proposed to give a short account of the main features of the technique employed and a summary of the results obtained in a series of forty consecutive cases treated during the past year

Technique of Treatment

When the patients present themselves at hospital the affected area is cleansed with normal saline and all raised epithelium is removed An anaesthetic is rarely needed for minor burns, except in children or where the burnt area is heavily coated with some adherent domestic remedy such as flour Spirituous solutions are avoided Swabs soaked in amyl salicylate and abracide are applied direct to the area that in actual contact with the raw surface being only two or three layers of gauze in thickness Wool and a bandage are then adjusted The patient subsequently attends at four day intervals when if possible, only the outer swabs are removed and the thin one next the lesion is left *in situ* Fresh outer swabs wrung out of the amyl salicylate and abracide solution are applied after any excess of serous discharge has been wiped away As the burnt area dries up and epithelium grows over it the lowest or primary gauze layer loosers off and when it completely separates the lesion is found to be healed Under such conditions the patient has no pain

College of Surgeons of England, and to those who know the work he has done there it seems only natural that he should shoulder the burden and equally natural that he should bring it to an excellent conclusion The general summaries with which the author closes each of the two main portions of the book call for special mention They show both the great value of his work and the wide field there is for further research From the chapter on injuries of the jaw we learn that, comparably with what is observed in man, fractures of the maxilla in lower animals are apt to heal without bony union From the chapter on caries we learn that dental decay though rare, is not unknown in dogs, and that Sir Frank Colyer has found no support for the contention that immunity to dental caries depends on any peculiarity of the structure of the teeth The note on the tendency to dental variation of *Erythrocebus* may be quoted as an illustration of the philosophic tone of the book, and that on the multiple tusks of elephants as illustrating the author's clinical acumen There is but one point on which we differ from the author—we do not think that tartar on the external aspects of the mandibular incisors of the human being is always associated with mouth breathing

We may be excused for calling this book monumental Those who generously lent their aid, and the publishers, too, are to be congratulated in helping to so excellent a finish

DISEASES ASSOCIATED WITH PREGNANCY

Maladies des Femmes Enceintes By Henri Vignes Two volumes Vol I Pp 318 34 figures 40 fr Vol II Pp 206 25 fr) Paris Masson et Cie

Professor Henri Vignes with the collaboration of Drs G Lauret, J Olivier, and P Olivier Pallud has published two volumes on this subject The first deals with affections of the alimentary tract and the second with those of the liver, gall bladder, pancreas, abdominal parieties, and peritoneum together with diseases associated with malnutrition In his illuminating preface to the first volume the author points out that diseases associated with pregnancy *ne sont pas criees ex nihilo*, but that tares previously unsuspected, ripen as the result of pregnancy Some physicians do not like the conception of coexistences and attribute the diseases to the pregnancy, while others consider pregnancy to be purely physiological and therefore having no causal association with disease In the author's view the truth lies between these two extremes Certain affections can be attributed to mechanical factors, others to disturbances of the metabolism comparable with those of adolescence and those associated with frequent haemorrhages and with inanition Professor Vignes is not attracted to those views which suggest that these affections may be attributed to the fact that the foetus or the placenta floods the maternal system with abnormal lysins or proteins for he is in agreement with Bar that *la grossesse est une symbiose harmonique homogene*

Perhaps the best way of indicating the scope of this work would be to mention the subjects discussed in volume I The first ten chapters deal with diseases of the mouth the teeth, the pharynx and oesophagus the physiological changes in the stomach and disturbances of appetite vomiting dyspepsia gastric ulcer cancer of the stomach and Krukenberg's tumours The remaining ten chapters are concerned with the small and large intestines and discuss physiological changes in the intestine constipation, diarrhoea colitis worms and intestinal parasites typhoid fever cholera dysentery appendicitis intestinal obstruction and diseases of the rectum Further to give an idea of the manner in which these matters are studied the subjects discussed in the first chapter on diseases of the mouth will be quoted physiological changes in the mouth and the salivary glands, ptyalism, stomatitis gingivitis pyorrhoea epulis paraesthesiae inflammation of the parotid glands, and mumps If this rather dull catalogue, necessitated by the unusual scope of the volumes makes poor reading, the chapters themselves are fascinating It is amazing not only that one man could write authoritatively over such a wide field, but that such a wealth of information could be confined in so narrow a space It is probable that only a logical French mind aided by that most admirable of languages for terse and succinct phraseology, could have accomplished such a feat Nowhere is this faculty for compression more evident than in the section dealing with typhoid fever

We look forward with keen anticipation to the further volumes promised by the author Those already published are not suitable for examination purposes but present, without being ponderous, a wealth of information to obstetricians which so far as we are aware is not readily available elsewhere

Notes on Books

Under the title *Die Diat- und Insulinbehandlung der Zuckerkrankheit* (Vienna, J Springer, RM 4 80) another small book by Dr Franz Depisch has appeared on diet and insulin treatment in diabetes It is written for students and practitioners and is very thorough and interesting in its treatment of theoretical aspects Practical details are insufficiently represented to help the practitioner Indeed the latter is so thoroughly warned of the difficulties of treatment that he will hand the severe patient over to institutional treatment as soon as possible after reading this book

For a second year Dr Robert Broca and Dr Julien Marie have produced a survey of recent advances in French Paediatrics under the title *L Annee Pediatrique* (Paris Masson 32 fr) This consists of a series of sixteen monographs for which the authors have been mainly responsible with the collaboration of six colleagues in the whole or part of certain sections The result is a useful selection of topics by no means covering the field and of varying degrees of merit The first essay, on the modes of onset of tuberculosis in the child, is one of the best in the volume

The appearance of a second edition of Dr W R Aykroyd's fascinating book on *Vitamins and Other Dietary Essentials* (Heinemann 7s 6d) is to be welcomed The subject of nutrition is more and more engaging the attention of the educated public and the medical practitioner must now be able not only to prescribe diets for certain illnesses but be able to translate into everyday language what factors are required for the perfect diet in reply to the queries of his more educated patients Aykroyd's book is ideally fitted for imparting this knowledge either to laymen or to doctors In the most delightful style he recounts the fascinating story of the discovery of vitamins and other dietary essentials with illustrations of their practical application in various parts of the world Some of the chapters notably those on beri beri and pellagra read like a novel and yet are fully correct in fact In the preface to the second edition he states that he has not made many alterations but that if he were now rewriting the book he would adopt a more optimistic attitude towards the subject of malnutrition owing to the fact that there has been a general awakening of the public conscience to its importance The existence of such a book will contribute to this highly desirable awakening

and no cutaneous irritation or erythema has so far been met with

In some instances, owing to a more active exudation, such an "ideal" technique is impossible, and the entire dressing requires to be changed once or even oftener On occasion there is some scaling or even crusting after the main part of the surface has healed, and olive oil is applied until the scales or crusts separate Otherwise simple dry gauze dressings are used to protect the recently healed area for a few days

Results

Very trivial injuries being discounted, forty-two consecutive and unselected cases were treated during the period under review Two of these cases have been discarded, as the patients, though both doing well, did not complete their treatment at hospital Another patient (No 15, Table A) has not been included in the analysis of results (Table B), again on account of ceasing attendance prematurely Of the remaining thirty-nine patients, twenty-six were males with an average age of 27 years, and thirteen were females with an average age of 25 years Scalds accounted for most of the injuries, there being twenty-seven of these as against five burns by flames, four by hot or molten metal, two electric burns, and one burn by lime

Distribution and Extent—In most cases the limbs were affected, especially the arms, and it was found, as would be expected in patients treated on ambulatory lines, that injuries to the arms and hands tended to do better than those on the legs and feet The injuries were frequently multiple, but these have been considered as separate entities in the appended tables only where the duration of treatment has shown any marked disparity The extent of the involved area varied In some it was relatively small, but in others it was of considerable size—for example, the whole of one aspect of the forearm and wrist, or the lower third of the leg and whole dorsum of the foot Lesions of the fingers accompanied practically all those affecting the hands

Degree Duration and Initial Sepsis—In five patients the burns were of third degree, in the remainder they were of second degree (Dupuytren's classification) It will be noted in Table A, under the heading "Duration" (the approximate interval between the time of the injury and the first hospital treatment), that most of the patients presented themselves within a few hours In eleven cases, however, they did not come until one or more days had elapsed, and there was therefore potential or actual sepsis present from the outset of hospital treatment In certain cases, even when treatment was begun on the day of the injury, there was already a slight degree of infection, frequently due to the application of some unsuitable domestic remedy In Table B it will be seen that there is a direct relationship between the depth of the lesion, the presence of sepsis, and the length of time required for treatment

The Process of Healing—The results in this series were almost uniformly good Healing progressed steadily, and it was seldom that any of the patients complained of really appreciable discomfort Especially when the primary surface dressing remained intact and there was no excessive exudation, the treatment was painless throughout There was a noticeable absence of exuberant granulation tissue, and no cases of dermatitis were met with The resulting scars were smooth and pliable, though some showed a little surface scaling, which soon disappeared No contractures occurred Another point was that straight-

TABLE A

Case No	Injury	Sex	Age	Duration in Hours	Degree	Site	Initial Sepsis	Duration of Treatment in Days	Result

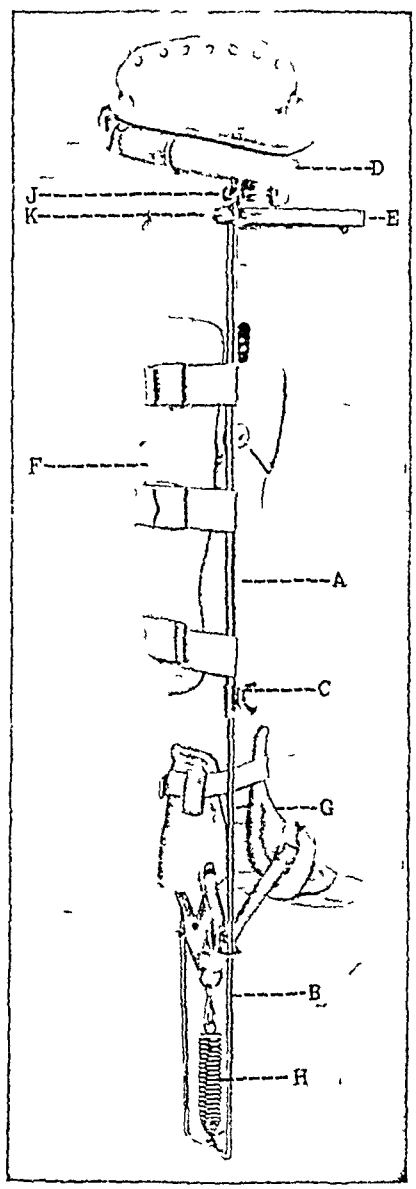
Third degree with little if any infection	4	36 5
Third degree with infection	1	65

Preparations and Appliances

UNIVERSAL FRACTURE SPLINT

Mr K H Pridie (Clifton, Bristol) writes



Fracture work is now being collected to fracture clinics where there are adequate facilities for the treatment of all types of cases and cases are being transferred from smaller hospitals to these clinics Many patients have to travel considerable distances and for these some form of efficient splint is urgently needed For this reason I am describing the universal fracture splint, which has been designed for me by M Masters and Sons, Ltd, London The splint was primarily designed for the first-aid treatment of fractures, it is completely adjustable for child or adult and will fit any size of thigh or length of leg It is therefore especially useful for ambulance service ships, and small hospitals where a large assortment of splints cannot be kept

Although designed as a first aid splint there are many cases where it can be used with advantage for treatment in hospital For example (1) for cases of fractured femur, (2) for cases of pathological fractures which need deep x ray treatment, as the patient can be moved from the ward to the x-ray department without fear of displacing the fracture During treatment it can be easily dismantled to allow the particular part to be irradiated

Description of Splint—The splint is a modification of the Thomas Knee splint, and is adjustable for length Instead of a circular ring at the top there are two divided segments, each one-third of a circle These are kept in position by means of an adjustable spacer The upper ring of this splint will expand to fit any circumference of thigh and will remain in position when the spacer is clamped Fraction for first aid purposes is obtained by means of a spat which fits over the shoe or boot This is attached by a spring to the end of the splint and by elongating the splint the required traction can be obtained The adjustable tray supports the leg The figures show the splint attached to an artificial leg

Details Shown in Figures—A = Main expansion bar, which is hollow to allow tube B to slide in This makes the splint adjustable in length and is controlled by the lock nut at C D = The upper ring of the splint The angle of the segments of the ring can be varied by means of the screw at J E = The spacer, which can be removed to apply the splint by undoing the nuts K It is adjustable in width by slide at I F = Adjustable back tray G = Spat for use as a first-aid splint over shoe or boot It is attached to the spring H at the end of the splint H = Spring attached at one end to strap from spat and at the other to the lower bar of the splint

Directions for Fitting Splint—Remove adjustable spacer marked E on one side only by undoing the nut at K The spacer can then be removed from tube A and swung outwards Undo the strap of the top ring and also the two lock nuts at C and the splint will become flat and can be slid under the leg The inner segment of the top ring marked D is adjusted to fit the crease of the but lock and to fit under the tuber ischii The strap of the top ring is tightened until it is a loose fit and the spacer E is then swung into position and re attached to the tube marked A The spat G is then applied over the shoe the wing nuts at C are undone and the tube B pulled from the tube A until the required traction is produced The wing nuts C are finally tightened The top ring D will then assume its correct position in relation to the groin

For transportation a bandage is applied round the whole splint and limb

IODIZED OIL

Iodatol (B D H) is a British made iodized oil issued for use in radiological diagnosis and in iodine therapy The specifications of the *B P Addendum, 1936* for iodized oil state it to be an iodine addition product of poppy seed oil containing 39 to 41 per cent of combined iodine and 'iodatol' conforms with this specification British Drug Houses Ltd (Graham Street City Road, N 1) have issued a well illustrated pamphlet showing radiographs of the bronchi obtained with "iodatol," and the text gives a full description of its mode of administration Samples will be sent to medical practitioners on request

forward healing was obtained in a number of cases in which there was some degree of initial sepsis In five cases the result has been classified as only fair,' more on account of the fact that some sepsis was encountered during treatment than because the eventual result was not satisfactory Only in two of these five cases was it necessary to substitute stronger antiseptic measures for a day or two during the course of the treatment Further, it will be noted from Table A that in three of these patients initial sepsis of more or less marked degree was present when they first attended, and in another the burn was a deep and extensive one on the forearm (No 40) One other case (No 7) calls for special mention This patient was an epileptic, and sustained a third degree burn of relatively small size but situated in the avascular scar of an old burn of the leg Healing was accordingly slow and he had to attend for sixty-five days

Illustrative Cases

Case I (No 24)—The patient was a female aged 38 She was seen on April 8 1936 two hours after a scalding accident to the right leg Examination showed a four inch by three inch second-degree lesion above the right internal malleolus Primary dressings as above Healing progressed very satisfactorily with no exudation through the surface gauze layers A photograph taken on April 27 shows the surface gauze in position and a second one taken on May 5 after the gauze had separated spontaneously shows a perfectly healed skin area with slight scaling in its centre (see Special Plate) No pain throughout

Case II (No 16)—The patient was a male aged 38 He sustained second degree burns of the face neck and whole length of the left forearm caused by a blow back from a furnace. *The accident occurred on March 23 1936 and he* attended hospital one hour later The raised epithelium was removed and the surfaces cleansed with saline Amyl salicylate and abracide dressings were applied The gauze layers in actual contact with the raw surfaces were left intact and only the top layers were changed at three and four day intervals Progress was rapid By March 30 the lesions on the face and neck were healed and by April 7 the forearm was likewise fully healed No pain throughout Comment A recent clean second degree burn primary surface dressing remained *in situ*

Case III (No 39)—A girl aged 16 was scalded on the right foot on June 4 1936 A thick layer of flour was applied at home and she attended hospital on June 5 Examination showed an extensive, moist, mildly infected second degree lesion over the dorsum of the foot and the front of the ankle In this case there was some exudation so that the whole thickness of the dressings had to be changed three days later Thereafter though there was a minor degree of exudation the deep surface gauze was left intact and healing progressed satisfactorily being complete by June 29 There was some discomfort during the first five days of treatment Comment A mildly infected injury of twenty four hours duration which however progressed satisfactorily

Case IV (No 34)—A woman aged 40 attended on May 28 1936 with a five days old second to third degree lesion on the foot caused by a scald There was a brown slough in the centre and the surrounding skin was congested and swollen Considerable pain After gentle cleansing amyl salicylate and abracide dressings were applied Owing to the nature of the case there was considerable exudation of sero pus and the whole thickness of the dressings had to be changed at four day intervals By June 15 the condition was painless and the surface very clean Healing was complete by June 29 Comment A quite markedly infected burn treated throughout by amyl salicylate and abracide

Summary

1 Clinical tests in a hospital out patient department have indicated that amyl salicylate possesses analgesic properties and can be satisfactorily employed in the treatment of minor burns

2 It lacks the coagulant effect of tannic acid on the tissues, and is therefore unsuited to the treatment of severe and extensive burns where there is a danger of toxaemia and shock

3 The ester has little if any bactericidal power, and it therefore requires the addition of an antiseptic In this series a mixture of isomeric substituted phenols, known by the trade name abracide,' has proved suitable

4 The method is applicable to the treatment of infected as well as non infected burns and scalds, provided the initial infection is not too severe

5 Standardization of technique is very necessary if the best results are to be obtained

6 Amyl salicylate has an extremely penetrating smell but the results obtained with other less pungent salicyl esters have been inferior

I am indebted to Dr T H Durrans, director of research and development to Messrs A Boake Roberts and Co Ltd for advice and assistance throughout the inquiry I am also sincerely grateful to Sister Dewar of the *surgical out patient* department of the Edinburgh Royal Infirmary without her constant supervision of the work of her staff the investigation would have been impossible

A NOTE ON LITHOPAEDION

WITH REPORT OF A CASE

BY

PAUL CAVE, M B, D M R E

Honorary Radiologist Royal Berkshire Hospital

(WITH SPECIAL PLATE)

Of all pathological conditions lithopaedion probably excites the most curiosity and for this reason few cases escape being reported In spite of this tendency to over publicity the number of cases in the literature is relatively few For instance up to 1933 the total was 196 cases and the number added since then is insignificant Another illustration of its rarity is derived from the figures of the Mayo Clinic for the years 1903 to 1926 During this period nine lithopaedions were found in 445 cases of extra uterine pregnancy The incidence of 2 per cent is probably the highest that will ever be recorded as with increased recognition of a retained foetus lithopaedion formation will become still more rare The paucity of cases is not surprising when one considers the combination of circumstances which must be present before a lithopaedion can be formed

First, the pregnancy must be extra uterine It is true that about half a dozen cases of intra uterine lithopaedions are reported in the very early literature but since none have appeared within the last hundred years it is rational to view their authenticity with extreme scepticism Nor is it possible to discover a case of lithopaedion in the record of pregnancies in bicornuate uteri Even in a case in which almost full term twins were retained for twenty years in a bicornuate uterus the e was skeletonization but no calcification

Secondly the foetus must survive for longer than three months It death occurs while the bones are cartilaginous absorption will be rapid and complete In tubal pregnancy advanced development is rare and if the tube ruptures on its free side the embryo usually dies in the peritoneal cavity But secondary intraligamentous implantation is said to favour survival

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 20 1937

WHEN IS ABORTION LAWFUL?

Medical practitioners in general and gynaecologists in particular have constantly at the back of their minds a doubt which from time to time becomes acute That doubt is Can an operation to terminate pregnancy ever be lawful? It is not pleasant for a doctor to feel that in the course of practice he may with perfectly honest intentions commit a serious offence The trouble comes, like many others, from the nebulous state of a good deal of our law It has from time immemorial been an offence against the laws of the Church and of the land to cause a woman to miscarry, and the principle is embodied in the Offences Against the Person Act, 1861, Section 58 This section prohibits a woman with child from procuring abortion on herself, and then lays down that "whosoever shall unlawfully supply or procure any poison or noxious thing, or any instrument or thing whatsoever, knowing that the same is to be unlawfully used or employed with intent to procure miscarriage of any woman, whether she be or be not with child, shall be guilty of a misdemeanour, and being convicted thereof shall be liable to be kept in penal servitude "—for life As far as the professional abortionist, qualified or unqualified is concerned this section presents no difficulties To the law abiding practitioner the crux of the matter is the word "unlawful" This word is nowhere defined in the Act and since the case of R *v* Bliss,[1 2] in which a qualified woman doctor was sent to penal servitude for three years for unlawfully procuring abortion and had her name erased from the *Medical Register* medical men and women have been asking themselves whether in emptying the uterus for reasons which have seemed good to them in the patient's interest they have made themselves liable to a similar punishment The letter over the signatures of three practitioners in Kenya published in our correspondence columns this week may express a general uneasiness

Research into the legal authorities ends as soon as it begins The reports contain no case in which the question has ever been dealt with by a judge even in passing There is however, a crumb of comfort in the section itself By an ordinary rule of interpretation the lawyer assumes that when the legislature prohibits citizens from doing an act unlawfully it must have in mind a lawful way of doing the same act for otherwise it would have been idle to use the word "unlawfully" This view was expressed by Mr Justice Salter in a discussion on criminal abortion held by the Medico Legal Society in 1927 and reported in this *Journal* Taylor[3] quotes an opinion given by counsel to the Royal College of Physicians in 1896 which goes a good deal farther "We are of opinion that the law does not forbid the procurement of abortion during pregnancy or the destruction of the child during labour where such procurement or destruction is necessary to save the mother's life" *Russell on Crime*[4] goes farther still and says "The word 'unlawfully' excludes from the section acts done in the course of proper treatment in the interest of the life or health of the mother" As the original author of this work is dead this passage may be cited in court as an authority, and would doubtless be treated with great respect Taylor, developing the subject, takes a conservative view, and says that it is obvious that the only reasons justifying the induction of labour are to save the life of the mother or to save the life of the child The learned author quotes the opinions of various eminent gynaecologists who spoke at a discussion held during the Annual Meeting of the British Medical Association in 1926 in the Section of Obstetrics and Gynaecology, and says that the majority of the Section seemed to agree that abortion should be advised only for some definite morbid condition such as tuberculosis, chronic nephritis, heart disease and certain others, that no one of these diseases could be looked upon as a reason for always terminating pregnancy, but in a particular case any one of them might render abortion necessary The indications for therapeutic abortion have often been discussed by the heads of the medical profession, and are not a subject of much controversy they can be found in every good textbook of obstetrics and gynaecology

This very absence of legal authority may reassure the law abiding doctor for it indicates that law-abiding doctors never are put in peril for terminating pregnancy on recognized medical grounds It is a matter of common knowledge that the profession contains a few members who choose to run the risk of prosecution and who terminate pregnancy without good medical reasons yet the prosecution of one of them excites intense and widespread interest simply because the prosecution of a reputable registered practitioner for this offence is

[4] Ninth edition vol 1 p 517

Thirdly, the condition must escape medical notice, else it will be terminated by operation, also the mother must survive long enough for calcification to occur The shortest recorded period is fourteen months from conception, but usually it is many years before the discovery is made

Fourthly, the foetus must remain sterile Infection will certainly produce absorption, and moreover will lead to symptoms necessitating operation

Fifthly, the necessary conditions for deposition of calcium in the tissues must be present What these conditions are is not fully understood, but an important factor appears to be a sluggish local circulation In this connexion it is significant that in almost every case of lithopaedion no trace of placenta could be found An exception to this is recorded by Clark, who found a large necrotic friable placenta attached to the pelvis In his case, however, there were only a few patches of calcareous matter sparingly interspersed through the external portions of the tissues and in the enveloping membrane

It would seem probable that the absence of calcification in foetuses retained in a bicornuate uterus, even after the lapse of many years, is explicable on the grounds that the circulation is too good for these changes to occur

Classification of Lithopaedions and Diagnosis

The sites in which calcium is laid down have formed the basis of a classification of lithopaedions into three types

1 Lithokelyphos —The membranes alone are calcified and not adherent to the foetus The foetus may be unchanged, mummified, or skeletonized This type is supposed to be due to the membranes remaining intact at the termination of pregnancy

2 Lithokelyphopaedion —The membranes and foetus are calcified and are adherent to one another This type follows the escape or absorption of amniotic fluid

3 Lithotecnon (true lithopaedion) —The foetus alone is calcified, the deposition of lime salts starting in the vernix caseosa The escape of the foetus into the abdominal cavity leaving its membranes behind, is said to account for this type

Lithokelyphopaedion is probably the most common of the three

The discovery of a lithopaedion is often accidental—in the course of clinical examination or radiographic investigation, or at post-mortem The patient may be unaware of her condition The usual history is of a "mock labour" followed by gradual decrease in the size of the abdomen and the return of menstruation Progressive shrinking of a full-term foetus to a calcified mass the size of a fist has been observed radiographically by Sante and Emmert On palpation of the abdomen a hard mass may be felt above the pubis Sometimes the patient knows of its existence but attaches no importance to it on account of the absence of pain or discomfort

In 60 per cent of cases late symptoms occur There may be mild abdominal pain, sense of fullness in the pelvis, cystitis, vaginal discharge, and sciatica and constipation from intrapelvic pressure Abdominal adhesions and rupture of the lithopaedion into adjacent viscera are the commoner serious complications Diagnosis by radiography is usually simple The presence of foetal limbs distinguishes the shadows from those of calcified fibroids or dermoid cysts Compression of the foetus is the rule There is overlapping of the cranial bones and often an acute dorsal or cervical kyphosis Distribution of the calcified areas varies with the type of lithopaedion

Present Case

An obese woman, aged 83, complained of pain in the left hip as the result of a fall She was referred to me for x ray examination The radiograph showed a crushed fracture of the greater trochanter, and also dense shadows in the pelvis Some of these shadows were obviously of foetal bones I endeavoured to get the patient to return for a thorough examination of the pelvis but she would not consent A few days later she died of cerebral haemorrhage Her only relative, a niece aged about 50 refused permission for a post mortem investigation, but agreed to an x ray examination of the body She informed me that her aunt had been a particularly healthy woman who had hardly ever required medical attention There was one child born about fifty years previously The niece remembered that some time after the birth of this child her aunt thought that she was again pregnant However, labour did not come on and the incident was forgotten The date of this pregnancy is not known, but it is likely to be more than forty five years ago

On palpation of the abdomen, when the body was brought for x ray examination I found a large, hard, smooth swelling resembling a foetal head above the pubis The antero posterior view shows a calcified full-term foetus lying on its left side in the pelvis The head is to the right and the back to the left of the midline The arms and legs are flexed The lateral view shows the breech lying in the hollow of the sacrum The head and thorax are above the pelvic brim The head is acutely flexed on the chest This view makes it obvious that the hard mass felt above the pubis was the back of the neck and shoulders and not the head There is very slight overlapping of the cranial bones but it is not sufficient to decrease materially the size of the foetal skull The thoracic and lumbar spines are almost straight

Calcification is chiefly in the membranes, which appear to be about the thickness of a foetal rib Calcification is also seen in the tissues especially in the arms Thus the lithopaedion may be classified under the type known as lithokelyphopaedion

I am indebted to Dr Leggatt of Newbury for permission to publish the case and to Mr A O Forder Royal Berkshire Hospital, Reading, for the radiographic prints

J Dorffel and W Lutterberg (*Derm Wschr* January 2, 1937, p 1) review the different causes of sterility in men Collected statistics show that bilateral gonorrhoeic epididymitis is responsible for 50 to 100 per cent of azoospermia The authors think that only those statistics are useful which are based on the examination of the ejaculated semen in all cases of bilateral epididymitis and not only in cases which come for examination as a result of alleged sterility The authors' personal investigations have shown sterility to occur in about 50 per cent of all cases of bilateral epididymitis Recanalization of the duct occurs only very rarely Azoospermia was found also in a number of cases of unilateral epididymitis and also in certain constitutional disturbances There seems to be a relationship, too, between excessive smoking and azoospermia

extremely rare Broadly speaking an abortionist only comes to the notice of the police for one of two reasons his patient dies or gives information Except for the very rare cases of death from shock of the mysterious kind so ably described by Sir Bernard Spilsbury* the qualified abortionist hardly ever loses a patient, for he knows how to avoid sepsis and haemorrhage Mrs Bliss came to grief because some of her patients informed against her The law-abiding practitioner who follows Taylor's advice to get a second opinion and the written consent of the woman and her husband or guardian, and who only terminates pregnancy to avert genuine danger to life or health is not likely ever to have his action called in question In practice the police are very cautious in prosecuting even flagrant and persistent abortionists, they would not move in a case where the defence would rest on proper medical indication It is doubtful whether the authorities ever consider a prosecution which would rest on the legal interpretation of the word "unlawful" in the statute Practically all abortion trials are decided by evidence of fact, and the issue is whether the accused did or did not perform an abortion The illegality of the operation is never in issue In the Bliss case the accused, it is true, said she only perfoimed the operation on women who were already suffering from an attempt at abortion, but she was found guilty, not because this was an insufficient defence, but because the jury did not believe her There is no real doubt, either in law or in practice, that a doctor who empties the uterus of a patient who comes to him "bleeding, possibly septic," from an attempt to procure abortion is running no risk whatever A medical man need have no fear of being convicted, or even accused, on a legal technicality if he terminates a pregnancy with the honest intention of averting damage to health and life If he widens the indications to include speculative grounds he will lose the support of the consensus of his professional brethren If he empties a gravid uterus merely because the woman does not want to bear the child he acts at his peril

HOSPITAL CO-OPERATION IN LONDON

A section of the Local Government Act, 1929, laid it down that local authorities when providing hospital accommodation should consult a committee representing both the governing bodies and the medical and surgical staffs of the voluntary hospitals of the area It was a narrow field of co-operation and in some areas though not in London it has been narrowly construed The British Medical Association has maintained that in order to get any satisfactory scheme of co ordination there must be more than mere consultation and that both sides must get together to set up a body which would devise means for bringing into line the admission of patients as between the various hospitals as well as advise on the development of new accommodation The Voluntary Hospitals Committee of the County of London which was constituted in July 1935, by the amalgamation of the London Voluntary Hospitals Committee and the London Regional Committee of the British Hospitals Association, has issued a report of its activities covering the last eighteen months The committee represents the twelve hospitals with undergraduate schools twenty-nine general hospitals without schools, including three by special arrangement outside the county and sixty six special hospitals It has been recognized by the London County Council and the King Edward's Hospital Fund as representative of the voluntary hospitals, and its contacts with the L C C have not been limited to the question of accommodation but have ranged from exchange of information about extensions of services down to rates of pay of miscellaneous staff The committee suggested regular meetings with the Hospitals and Medical Services Committee of the Council for the general discussion of hospital policy, but this idea was apparently too radical and conferences between the two bodies are only called when definite questions arise With regard to King Edward's Hospital Fund an arrangement has been concluded whereby in future every voluntary hospital in the county before submitting to the Fund any important scheme of extension or reconstruction will be asked to ascertain the views of the Voluntary Hospitals Committee Liaison has also been established with the Ministry of Health which will consult the committee on all matters, including those relating to medical education, in which the voluntary hospitals of the county are largely affected by any of the Ministry's proposals The committee has participated in the work of a larger body, representing other interests, in discussing with the London County Council the scheme which the Council is devising for a salaried service of midwives under the new Act

One useful piece of work now under consideration by the committee is the proposal for the provision of a central office—a sort of clearing house—to facilitate the admission to voluntary hospitals of emergency and acute cases It is the common experience of a medical practitioner in urgent need of a bed for a patient to have to telephone to a number of hospitals before he can find one which is able to receive the case Such a central office

AN OPERATION FOR THE CURE OF ADULT HYPOSPADIAS

BY

ARCHIBALD H McINDOE, M S , M Sc
F R C S , F A C S

ssistant Plastic Surgeon St Andrew s and St James Hos pitals Chief Assistant in Plastic Su_gery St Bartholomew s Hospital Cor sulting Plastic Surgeon North Staffordshire Royal Infirmary

(WITH SPECIAL PLATE)

ose who undertake the responsibility for the radical re of hypospadias know that it can be one of the most fficult of all surgical conditions to bring to a successful nclusion Cabot (1935) points out that the basic require nts of a thoroughly satisfactory operation are that it ould overcome the disability and avoid the production new disabilities such as stricture formation or growth hair within the newly formed urethra At the same ne it should be sufficiently simple and certain of free m from post-operative complications such as fistula mation, to enable it to be carried out with a reasonable ospect of success by a well trained surgeon

Technical Problems

e construction of a new urethral canal demands a h degree of technical skill, even then it may fail, ause the method necessarily violates some of the dinal principles of plastic repair, particularly when olied under the disintegrating effect of the urinary am There is, in fact, real need for an operation ich is reasonably easy to perform and more certain success than many of those in common use Apart m associated abnormalities such as hernia or retained es, the three practical considerations in the hypospadiac concerned with the redundant dorsal prepuce, the tral penile curvature, and the absent urethra Briefly, dorsal prepuce is disposed of by incorporating it into ventral length, either by the excellent method of nunds (1926) or by the more recently described pro ure of Browne (1936) The effect of this is to distribute available skin equally over the penile surface in such ay that the dorsal excess is transferred to the deficient ral surface Straightening of the ventral penile ve is effected by removal of the urethral cord and remains of the corpus spongiosum Finally a new hral canal must be constructed

here is no particular difficulty in carrying out the first second of these procedures, chiefly because they are to perform, and the suture line is not subjected to passage of urine over it It would be generally agreed the third problem—namely, the construction of a urethra—is the most difficult step in the necessary s of operations Certainly the extraordinary number roposed methods bears this out, and an examination hem will show that while some are practical and ble others are fantastic and have no possible use

l of them rely upon one of three different methods lastic repair—namely, the use of local flaps tube les or free grafts The first is satisfactorily repre- d by the various modifications of the Marion–Duplay) procedure, Cabot s (1935) modification of Buck- (1907) operation and Ombredanne s (1923) opera The second depends upon the use of extraneous transplanted from a distance by means of the s tubed pedicle Free grafts are made use of in rocedures of Nové Josserand (1914), Rochet (1932), and Mayo (1901) While all of these methods have been successfully employed on many occasions the last—namely the use of free grafts—has fallen into disuse and has been generally condemned

More recently Borchers (1928) and Begg (1935) have recorded interesting experiences with the tunnelling operation and have suggested modifications in technique To anyone who has had experience of the great success of the Esser (1917) principle of inlay grafting it would appear that free grafting is the most reasonable method of constructing a new urethra It can be undertaken with a high degree of certainty without utilizing penile skin and with none of the dangers of breaking down associated with suture lines in this region In this communication I wish to show that Nové Josserand s operation, when modified in certain important particulars is not only feasible but gives in adult hypospadias what I believe to be the simplest and most satisfactory method of producing a new urethral canal

Principles of the Operation

Nové Josserand proposed that after the usual straightening of the ventral curvature a tunnel should be bored through the penis from the posterior fistula to the tip of the glans and a catheter covered with Thiersch graft be inserted into the canal He recommended that the catheter should be removed at the end of eight to ten days and the skin lined passage be dilated periodically with bougies Anyone with an intimate knowledge of the behaviour of grafted skin will admit the immediate criticisms that such contraction will occur that the canal would become hopelessly stenosed and periodic dilatation will fail to maintain its patency This is in fact the uniform result of the operation, and explains why it has fallen into disuse

The modern epithelial inlay demands the introduction of thin hairless epidermis into a subcutaneous cavity made larger than the ultimate size required and maintained in a distended position for a period which exceeds by a considerable margin the contractile phase of grafted skin—namely three to six months Under these conditions an epithelial canal can be constructed in which stenosis does not occur

I was first encouraged to try the effect of a penile epithelial inlay in an adult patient with hypospadias in whom so many operations of a flap type had been performed that the ventral skin of the penis was scarred beyond any hope of making local flaps After constructing a tunnel through the penis I introduced a skin covered catheter and maintained the patency of the new canal continuously for a period of six months At the end of that time the proximal end of the new canal was anastomosed to the hypospadiac meatus with such a satisfactory result that I have employed the same principle on other adult cases with gratifying results So far it has not been used for children

The method however has been considerably modified It would seem a comparatively simple matter to introduce a skin covered catheter through the penile tunnel It is, in fact, extraordinarily difficult to do so and at the same time to prevent the graft being rucked off the catheter during its passage along the tunnel An introducer was therefore devised which overcomes this difficulty and renders the operation extremely easy The instrument resembles a large suprapubic trocar, except that the handle and the cutting point can be unscrewed, leaving a smooth hollow barrel five inches long and with an internal

if it could be established, would inform him forthwith where to send his patient and would warn the hospital of the impending arrival Thus the doctor's time and energy, and perhaps his temper, would be saved and the patient's anxiety relieved Sixty-one hospitals have expressed a willingness to co operate in such a proposal, and three have expressed dissent Like many schemes which seem on the face of them so full of common sense and so simple to bring about, it bristles with difficulties as soon as details come to be considered, but a subcommittee is busy upon it, and a scheme will in due course be laid before the constituent hospitals The interest with which the suggestion has been received is felt to justify a very real endeavour to put it into practical shape The committee, after touching on various other activities which have engaged its monthly meetings, gives a hint to hospitals in general Every effort it says will be made to ensure that they are not unnecessarily troubled for information, and when they are troubled it is hoped they will respond with as little delay as possible The chairman of the committee is Mr O N Chadwyck Healey, the vice chairman Dr A M H Gray and the honorary secretary Professor L S Dudgeon

THE TREATMENT OF BURNS

Had he been alive to day E C Davidson of Detroit who in 1925 introduced the tannic acid coagulation treatment of burns would no doubt be very gratified by the fact that his method has led to standardization of treatment and a considerable reduction in the mortality from burns He would find a still further source of gratification nearly half the lethal burns in the United States occur in young children and in his old clinic at the Children s Hospital at Detroit the tannic-acid treatment has reduced the mortality from 36 to less than 10 per cent [1] There can be no doubt that the treatment of severe and extensive burns by coagulants such as tannic acid—or by its more recent adjuvants or variants such as silver nitrate and ferric chloride solutions—represents a great advance in surgical therapy In this country Mitchiner at St Thomas's has been an ardent advocate of the new treatment In Edinburgh an investigation has recently been made into toxin formation in burned tissues by Wilson Jeffrey Roxburgh and Stewart [2] Their problem was to ascertain the nature of the so called "acute toxaemia" which supervenes after the periods of initial and secondary shock some six to fifty hours after a severe burn From time to time criticism of the view that this phase is a true toxaemia has been raised on the grounds that there has been no satisfactory evidence for the actual formation of toxins in burned tissues The Edinburgh investigators, however have been able to show that the oedema fluid which accumulates in a burned area gradually acquires toxic properties probably as the result of autolysis of the injured tissue and that it exerts toxic effects on the nervous and circulatory systems and on the liver cells It would appear that absorption of toxin from the burned area is the factor responsible for the stage of acute toxaemia and that it is unnecessary to regard as of primary importance such factors as increased concentration of the blood early bacillary infection or changes in blood chemistry thus is explained the great value of coagulants such as tannic acid in preventing the formation of the toxins at the site of their origin Tannic acid may, however be misused and attention has been drawn to the fact that its application in burns of a minor character may produce unnecessary destruction of epithelium and some delay in healing It has been suggested therefore, that the coagulation treatment should be reserved for more severe burns and that bland wet dressings and ointments may with advantage be used for minor and less extensive cases The solutions employed for this purpose have been many and varied from mercurochrome in 2 per cent concentration [3] to cod liver oil advocated so enthusiastically for some time now by Professor Wilhelm Lohr of Magdeburg A report of a new remedy for the treatment of minor burns by Mr Leslie Stewart of Edinburgh appears in this issue of the *British Medical Journal* (p 380) He finds that amyl salicylate exerts a valuable analgesic effect and when blended with a liquid mixture of isomeric methyl tertiary butyl phenols ("abracide") produces a stable antiseptic preparation which still maintains analgesic properties Details of technique and of encouraging results will be found in the author s paper It must be clearly understood that amyl salicylate is not for use in extensive burns for which coagulation is imperative but for the treatment of minor cases particularly of scalds it will no doubt be widely tested

RAT-HUNTING IN HAWAII

Maui is the second largest of the Hawaiian Islands with an area of 728 square miles and a population of 52 000 Cultivation of the sugar cane is the principal industry pineapples are also extensively grown and quantities of cattle are raised in central Maui there are also numerous chicken farms and smallholdings The island is served by three ports but only at Kahului do vessels tie up alongside a wharf Plague was first reported in Maui in 1900 and was presumably brought there by the inter island steamer from Honolulu No further evidence of the disease occurred until 1930 when several deaths were attributed to plague although the first definite diagnosis was not made until August 1931 Subsequently there were five cases with four deaths the last case occurring in September 1932 During this period fifteen plague infected rats were found in seven foci but no further rat infection was discovered until October 1934 a year after A L Dompeyer, sanitary engineer U S Public Health Service came to the island [4] At that

diameter sufficient to admit a No 11–12 English gum-elastic catheter covered with Thiersch graft (Fig 1 on *Special Plate*)

Technique of the Operation

The operation is performed three to six months after the usual readjustment of the dorsal prepuce and the straightening of the ventral curvature A thin razor graft, or Thiersch graft, is cut from the inner side of the arm and carefully applied, raw surface outwards, like a cigarette paper, to a piece of No 11 English gum-elastic catheter, which just fits in width and length the barrel of the trocar The graft is tied at either end with a single strand of 000000 catgut It is then carefully placed in the barrel of the instrument and the cutting point and handle are screwed into position

With the patient in the lithotomy position a small stab incision is made just distally to the perineal meatus and another at the dimple usually present at the tip of the glans The trocar introducer is then thrust subcutaneously along the penis from the posterior stab incision until the point emerges at the tip of the penis (Fig 2) The manœuvre, while not easy, can be facilitated by introducing a long slender pair of scissors with Mayo points, in order to divide any fibrous bands which may obstruct the onward passage of the instrument When it emerges the cutting point of the introducer is unscrewed and the end of the skin covered catheter is gripped firmly with a pair of forceps The barrel of the instrument is carefully withdrawn through the posterior opening leaving the catheter in place and its skin covering undisturbed One-inch gauze tape soaked in mastisol is then bandaged round the penis fairly firmly, so that when the mastisol sets an efficient casing results which maintains the necessary pressure on the graft and prevents erection of the organ The entire procedure need not take more than twenty minutes to perform It is advisable to place a catheter in the bladder for forty-eight hours through the posterior meatus, in order to prevent urine coming in contact with the graft

At the end of ten days the casing is removed, the catheter is withdrawn, and the skin-lined urethra is syringed through with saline solution or half-strength eusol A fresh piece of gum-elastic catheter is immediately placed in the urethra, and at no time for the next three to six months is this left out for more than the five or ten minutes required to cleanse the canal (Figs 2, 3) It is necessary to make this point absolutely clear to the patient, for twenty-four hours without the catheter will cause hopeless stenosis of the cavity

After three to six months the contractile phase should be over, and the catheter can be safely left out In six months' time end-to end anastomosis of the posterior end of the new urethra and the hypospadiac fistula is performed over a short piece of catheter The nearer the perineum this anastomosis can be made the easier it is to perform Care is taken to see that the knots suturing the tiny lining flaps are drawn into the urethral canal If there is any difficulty about this Edmunds's method of passing a threaded needle backwards along the urethra in order to catch the knots and draw them through is useful The external covering flaps are sutured with mattress sutures of ophthalmic silkworm gut

Advantages and Difficulties

The advantages of this operation are many It does not require the diversion of the urinary stream at any time during its performance, and a short piece of catheter is really only required at the last stage of end-to end anastomosis I am not sure whether even then it is really necessary The introduction of the skin covered catheter is rendered easy by means of the introducer, and this important stage need take only a few minutes

As with other types of inlay graft, a perfect take should result in a very high percentage of cases, while continuous dilatation maintained until the contractile phase of the grafted skin is well over prevents subsequent shrinking and stenosis The appearance from the cosmetic standpoint is much superior to that of any other method, particularly at the meatus, which is placed at its correct anatomical position at the tip of the glans Thus the urinary stream is likely to be better projected than following operations of the flap type, where the meatus is more ventrally situated and a certain amount of spraying is common Another important advantage is that hair need not be included in the urethral lining—an all too common result of the flap operation

The total time taken to make a functioning urethra is, I think, rather longer than with other methods, owing to the prolonged period of continuous dilatation necessary, somewhere about nine to twelve months elapsing from start to finish On the other hand, the actual period of hospitalization is relatively short—five to six weeks—while between the four operations the patient is perfectly able to conduct a normal life From the surgical point of view one is freed from the tiresome and irritating business of closing and reclosing the fistulae which so often develop in adult patients along the suture line of the flap operation

The difficulties of the operation are chiefly concerned, first, with cutting a perfect Thiersch graft, and secondly, performing with considerable refinement of technique an end-to-end anastomosis of the new urethra to the hypospadiac meatus The first requires constant practice, the latter is made easier because it can be done at a point in the perineum or base of the penis where a substantial mass of tissue can be brought in from the sides to reinforce the internal suture line and so largely diminish the chance of leakage The only disadvantage of a Thiersch grafted urethra is that it is not extensible, but this is the fault of all operations for hypospadias

The new nurses' home at St Charles's Hospital, Ladbroke Grove, Kensington, was opened by the chairman of the London County Council, Lord Snell, on Friday, February 12 It was in 1934 that the Council decided to provide a new nurses' home and quarters for five assistant medical officers, the matron, and the assistant matron The building also contains a training school for nurses The total cost of the new home and of the new accommodation for the assistant medical officers, matron and assistant matron is about £38,425 St Charles's Hospital was erected about 1881, and since its transfer to the L C C on April 1, 1930, it has been "appropriated"—that is, taken out of the scope of the Poor Law, and is available to all residents in the County of London

time poisoning was the method in vogue for combating the rats, but owing to the abundance of natural food there was little inducement for them to take the baits, and the numbers were not sensibly diminished Of the fifteen plague-infected rats twelve were found to belong to the species *Rattus alexandrinus* and *Rattus rattus* It was inferred that these species probably preyed upon the smaller and more numerous native animal, *Rattus hawaiensis*, and that the last-named provided the true reservoir of infection The areas most heavily infested were old pineapple fields and the densely covered gullies, and some of these were accordingly cleared The burrows could then be located, and as many as 2,300, each containing one to four nests, were found in an acre of cleared land The native *R hawaiensis* far outnumbered the other species Carbon bisulphide proved to be the best means of treating the burrows The procedure is to apply a few drops of this substance to each burrow A lighted match is then thrown down, an explosion follows, and a flame runs through the tunnel system killing the rats within, while the emanation of the yellowish fumes provides a means of locating further connecting burrows Finally the openings are plugged with earth and well tamped The clearing and burning of undergrowth, which necessarily preceded these measures, by diminishing natural food supply and exposing rat harbourages facilitated the task of poisoning by bait, while rats were also killed by clubs and any other means available As a result of this work six plague-infected rats were taken, five of which belonged to the species *R hawaiensis* There were two other important reservoirs of rats Large numbers of *R alexandrinus* and *R rattus* nested, like birds, in the algaroba trees, which produce the rats' food supply in the form of beans These nests, often containing as many as thirteen rats, were readily brought down with a shot-gun, after access had been gained by clearing and burning the brushwood Other rats lived in great piles of rock, which were successfully treated with calcium cyanide dust, the rock retaining sufficient moisture to generate the gas As a result of all these measures of "rat harbourage elimination work" the average daily rat catch was reduced from 8 41 to 0 67 rats per hundred traps in the plague zone districts within a period of thirteen months

PHYSICAL TRAINING AND RECREATION

In the White Paper on Physical Training and Recreation of which we gave an account last week (p 342), the Government announced its intention of appointing a National Advisory Council and a Grants Committee for England and Wales The council of thirty-one members has now been constituted, with Lord Aberdare as chairman and the Hon Edward Cadogan as deputy chairman The medical members are Viscount Dawson of Penn physician-in-ordinary to the King and Queen Mary and President of the Royal College of Physicians and Sir Kaye Le Fleming Chairman of the Council of the British Medical Association who was chairman of the B M A Physical Education Committee and represents the Association on the Central Council of Recreative Physical Training The secretary of the council and of the Grants Committee is Captain L F Ellis, who has now retired from the secretaryship of the National Council of Social Service in order to take up this new work Communications should be addressed to the secretary, Physical Recreation Committees, Queen Anne's Chambers, Tothill Street, S W 1

MANDELIC ACID IN URINARY INFECTIONS

The steps leading to the introduction of mandelic acid as a urinary antiseptic by Rosenheim are too well known to require iteration, but the treatment is still new enough for clinical experience and laboratory experiment to be worth recording The latest articles on the subject have come from America and Australia, where mandelic acid is proving as satisfactory as it has done in Britain Osterberg and Helmholz[1] record experimental work on the excretion and bactericidal activity of mandelic acid administered as the sodium salt They find that in doses of 12 grammes a day concentrations amounting to 1 per cent and more of mandelic acid can be maintained in the urine for many days, and a *p*H of 5 0 or less can be secured by the simultaneous use of ammonium chloride Such urinary conditions they show, are bactericidal for most organisms, though they are more effective against *B coli* or *B proteus* than against the cocci, the susceptibility of the latter appears to vary The difficulty with the *B proteus* is to produce *in vivo* a sufficient urinary acidity, since this organism synthesizes ammonia from urea The authors also show that there is a slight depression of renal function, as measured by the urea-clearance test during treatment, but that this is only temporary A high percentage of cures in *B coli* infections is recorded by Carroll, Lewis, and Kappel[2] with sodium mandelate by Cook and Buchtel[3] with various salts (sodium or ammonium or ethanolamine mandelate), and by Dolan[4] with ammonium mandelate, Silverton[5] from Australia reports favourably on the use of strong nitrohydrochloric acid as a urinary acidifier and antiseptic either alone or with mandelic acid salts There is general agreement that *B proteus* and coccal infections are more difficult to cure than *B coli* infections, and that patients should be investigated to exclude gross causes of urinary stasis before treatment Conditions such as hydronephrosis, calculus, or enlarged prostate must be appropriately treated, but even here mandelic acid will sometimes cure and often alleviate a coexisting urinary infection No serious untoward effects are reported Diarrhoea is an occasional result of the treatment, but is rarely severe Renal insufficiency, if advanced is a contraindication Haematuria has sometimes been observed during treatment by ammonium mandelate but as this may arise in untreated urinary infections we do not yet know whether it is due to the remedy or to the disease Acidification of the urine occasionally leads to a temporary increase of bladder irritability and

LARGE RENAL CALCULI

BY

D J HARRIES, M D, D Sc, F R C S.
Surgeon Cardiff Royal Infirmary

(WITH SPECIAL PLATE)

Unilateral renal calculus of enormous size has been encountered on several occasions as may be seen from perusal of the tables given below In Bradley's case 1909) the stone actually weighed 52 oz and in Waterworth's (1932) 38 oz In Morrison's two cases (1921) the eights are recorded with the remains of the kidney bstance, so that only approximate figures can be given the actual weight of the stones

Large bilateral calculi are much rarer, the largest re d being Gee's (1874), in which the right stone ighed 36¼ oz and the left 9¼ oz Next comes the esent case in which the right weighed 24 oz and the eft 9 oz Two other cases have been recorded in which he right weighed 5 oz and the left 4 oz in each instance t is almost incredible that renal calculi can grow to such im without causing severe symptoms In my case man had been aware of a lump in his right side or the greater part of a year, but it had hardly troubled him until a fortnight before admission into hospital Even it was only the onset of a perinephric abscess which d him seek medical advice

It is easy to understand why bilateral cases are much rer than unilateral ones In the latter the healthy dney is able to carry out the necessary renal function, hereas in the former the gradual destruction of both idneys is bound to produce symptoms of renal failure t an earlier date, even if no complications supervene

Case History

A male aged 52 was admitted on July 1 1935 to Llandough ospital The patient had noticed a lump in the right side the abdomen nine months before The swelling grew ly bigger although it caused him no discomfort until fortnight before admission when he started having pain in e right side of the abdomen and in the back The pain of a dull aching character with no suggestion of acute l colic He had lost about 2 st in weight during the last months So far as he knew there had been no blood the urine at any time

The general condition on admission was moderately good, temperature was 99 F pulse rate 70 The specific gravity the urine was 1008 with slight albumin no sugar no and some pus Examination of the abdomen showed large tumour filling the right loin and extending as far the middle line The tumour was hard with cystic areas which fluctuation could be made out There was no area resonance in front of the tumour The left kidney was lpable and definitely enlarged At this stage the condition s suspected of being either a neoplasm of the right kidney, hypertrophy of the left or polycystic disease of both neys On July 5 the abdomen was x rayed and the con n shown in the first film found (Fig 1 Special Plate) film gives a good idea of the size and density of the in each kidney At this stage the diagnosis was clear the right kidney was considered to be in a pyonephrotic on thus accounting for the cystic areas felt on pal on

In July 6 the blood urea was 40 mg per 100 c cm On 11 a cystoscopic examination was carried out the bladder ed several tiny stones and one projecting from the right this was dislodged into the bladder the left ureteric was normal Indigo carmine was then injected intra ously and in thirteen minutes the dye appeared from the ureter but none appeared after thirty five minutes from right pressure on the loin tumour caused no discharge n this ureter

Operation and Necropsy

On July 16 the abdomen was opened under general anaesthesia through a right paramedian incision The ascending colon was found displaced well inwards by the tumour After packing off the intestines the peritoneum was incised vertically and a collection of pus found in the perirenal tissues The stretched kidney was incised along the outer border and about a pint of pus escaped The stone was then removed almost intact As there seemed to be a considerable amount of kidney tissue present it was decided to preserve it A drain was inserted into the perirenal space and the end brought out through an extraperitoneal stab incision in the loin The peritoneum over the kidney was then sutured and the abdomen closed The patient made good progress after the operation secreting about forty ounces of urine daily The specific gravity remained between 1008 and 1012 and there was a trace of pus present The loin drained pus for a week

The patient's condition was satisfactory on July 26 and he was told that he would be discharged within a week and was asked to make arrangements to return in about a month for removal of the stone in the other kidney On July 28 he died suddenly Unfortunately a complete post mortem examination was not obtained but the relatives gave permission for the abdomen to be investigated through the abdominal incision The photographs give a very good idea of the state of the kidneys when removed from the body (Figs 2 and 3 Special Plate)

The stone in the right kidney weighed 1¼ lb before drying and 1 lb 6 oz after drying (Fig 4, Special Plate) The weight of the left stone and kidney after hardening for mounting was 13¼ oz It was decided not to damage the specimen by removing the stone but to expose it by incision along the convex side If we assume that the weight of the kidney substance does not differ much from that of the normal kidney—namely 4¼ oz—the weight of this stone is about 9 oz

Bilateral and Unilateral Calculi

The following tables give some idea of the size that renal stones can reach

cystitis. With regard to the prevention and the control of treatment there is also general agreement. 3 grammes of mandelic acid four times daily seem to be efficient dosage for adults. It may be given as the sodium salt with ammonium chloride or nitrate to render the urine sufficiently acid or as the ammonium salt when an underlying urinary infection is as a rule unnecessary. In some cases in which adequate urinary acidity has been obtained only when an acid-ash diet or even a ketogenic diet has been ordered as well. Fluid intake should be limited during treatment. In successful cases sterile urines are obtained in from two days to three weeks. None of the papers herein discussed however deals adequately with recurrences. To those in this country with experience of mandelic acid the real problem is the chronic case which though rapidly responding to treatment relapses (often with an acute attack) within a few days or weeks. Repeated courses of treatment only result in as many relapses and a return is eventually made to sulphonamides or the less efficient urinary antiseptics which can be continued over an indefinite period. Mandelic acid is a new remedy of great efficacy but it must be given in accordance with the rules laid down by those who have experience of its use.

THE POST OFFICE AND THE CORONER

It is sometimes necessary for the purposes of a coroner's inquest to send pathological specimens by post to the public analyst. Nearly all medico-legal textbooks contain precise directions for the packing of specimens and on the whole no difficulty is encountered. An unfortunate incident recently occurred however in the Isle of Wight which shows how defective packing may bring the coroner's court into conflict with the Post Office authorities. A man of 55 suffered from pains in the back and his doctor prescribed medicine and liniment for him. One evening when the bottle was almost finished the man became violently sick and died in a few hours from acute gastritis. The necropsy gave no clue to the cause and the Ryde coroner decided that the viscera had better be sent to the public analyst at Southampton. They were therefore packed in two jars which were wrapped in corrugated paper and placed in a tin box the remaining space being filled tightly with straw. In a few days the coroner received a message that the parcel had leaked and that the postal officials had destroyed it. At the adjourned inquest the assistant superintendent of the Portsmouth General Post Office through which the parcel had been sent said that the Post Office regulations provided that deleterious liquids or substances, though otherwise prohibited from transmission by post might be sent for medical examination or analysis to a recognized medical laboratory or institute by letter post and on no account by parcel post. The specimen must be enclosed in a hermetically sealed or otherwise securely closed receptacle, which itself must be enclosed in a strong wooden leather or metal case in such a way that it cannot shift about with sufficient quantity of absorbent material to prevent leakage. The packet must be conspicuously marked "Fragile with care" and "Pathological specimen." Any packet of the kind not packed and marked as directed must be at once stopped and destroyed. Postal officials have definite instructions that a package likely to cause contamination must be destroyed. The coroner while not challenging the right of the official to destroy the parcel commented that the words "Pathological specimen" on the wrapping and the strong smell were a very good reason why it should not have been destroyed. Many laws he said exist to protect the Government but they are not necessarily carried out with extraordinary force. The jury agreed and expressed the opinion that the parcel should have been set aside for further inquiry. The Post Office witness undertook to transmit this opinion to the central authorities. The inquest was adjourned again in order that the remaining dose of medicine in the bottle might be analysed. It was found to contain 58 grains of aspirin owing presumably to inadequate shaking at earlier doses. The last dose taken by the deceased might have contained 40 grains of aspirin but this should not cause fatal gastritis. The jury returned a verdict that the deceased died from acute gastritis and that they were unable to reach a definite conclusion about the cause as the viscera had been destroyed by Post Office officials in accordance with the regulations. They expressed the opinion that the regulations should be modified so as not to apply to pathological specimens in transit to a public analyst and that such packages should not be destroyed without a personal inspection and order for destruction by a superior officer of the G.P.O. This must be a very rare accident. The best precaution would probably be to use toughened glass containers and to label the parcel conspicuously with the name of the coroner's court. If this had been done in the present case the local Post Office authorities might have thought twice about destroying what turned out to be the only evidence which the coroner's court had of the cause of death. It would be better never to entrust such specimens to the post at all but to send them by hand; this however may in some cases be impracticable.

The Queen has assumed the office of President of the British Red Cross Society under the Royal Charter of the Society. The Duke of Gloucester has become chairman of the council of the Society, taking the place of his brother who is now King and who becomes Patron of the Society. The Duchess of Gloucester has become a member of the council of the Society.

Sir Henry Brackenbury has accepted an invitation to stand as an Independent candidate for the Combined English Universities at the forthcoming Parliamentary by-election.

We much regret that by a slip of the pen Professor Cathcart's collaborator in *A Dietary Survey in Terms of the Actual Foods Consumed* was wrongly given in our leading article last week (p. 334). The correct name is Mrs. A. M. T. Murray.

[1] *See* Brit. Med. Journ. January 2 and 9, 1937.

Several other cases have been recorded of unilateral stones weighing under a pound, the majority being somewhere between 8 and 14 oz Two bilateral cases have been recorded, in each the stone in the right kidney weighed 5 oz and in the left 4 oz

A piece of the stone from the right kidney was analysed and was found to consist of calcium phosphate, calcium carbonate, ammonio-magnesium phosphate, and some organic matter It did not contain any urates, uric acid, oxalates, cystine, or xanthine

I am indebted to Dr Garfield Evans for the x-ray picture (Fig 1), to Mr R H Lindley for the photographs (Figs 2, 3, and 4), to Mr W H Dunstan for analysing the stone, and to the Librarian of the Royal Society of Medicine for the tables of bilateral and unilateral stones The specimens which I have described are now in the museum of the Royal College of Surgeons of England

Clinical Memoranda

Cerebral Congestion as an Aetiological Factor in Epilepsy

A considerable number of cases presenting some of the rarer aetiological factors in the causation of epilepsy have been recorded in the literature recently, and in consequence I think that the following case may be of sufficient interest to merit notice

On June 4, 1936, I saw in consultation a painter and decorator, aged 49, who was suffering from epilepsy During that day he had had ten major attacks in succession without recovering consciousness in the intervals The first instance of grand mal had occurred fourteen days previously, and he was given prominal Four similar attacks were recorded during the intervening two weeks It was noted that in 1919 for about twelve months he had complained of numerous momentary attacks of hemianopia, and had noticed a considerable number of periods of amnesia of very short duration In other respects the previous medical history was uneventful, with the exception that, particularly during 1935, he had been overworking and had experienced considerable financial worry, and in consequence had suffered from a degree of insomnia during that period

I saw him twenty minutes after an attack He was then unconscious with stertorous breathing and his face and neck were deeply cyanosed and congested The face gave the impression of being somewhat unduly puffy, it was interesting to note that this appearance had been noticed occasionally during the previous few days and apart from any attack, by both the patient's wife and his doctor He was a strongly built man, the pulse rate was 80 per minute, the temperature normal, and the blood pressure was 126/90 He showed no signs of gross organic disease The optic disks, pupils, and motor and reflex functions were normal The heart was not enlarged, the sounds were regular and clear, and there was no evidence of arterial degeneration in the superficial vessels No abnormality was found on examination of the lungs The urine was free from albumin and sugar Morphine was administered hypodermically, but before I left the house two further major attacks with typical motor phenomena occurred, accompanied by incontinence of urine

The patient was transferred to Leicester Royal Infirmary Twenty grains of potassium bromide with 30 grains of chloral hydrate were given as soon as he was able to swallow, and since no further attacks occurred this was repeated twice daily His condition gradually improved, and by June 8 he had apparently recovered and felt quite well Accordingly the chloral was omitted but the bromide was continued in the same dose Meantime the blood urea had been estimated and was found to be 37 mg per 100 c.cm of blood The urine was consistently free from albumin and sugar, it contained no pus blood, or casts, and urine cultures were negative Blood examination revealed 4,916,000 red cells per c.mm, haemoglobin, 87 per cent, colour index, 0·88, 9,687 white cells per c.mm, with 82 per cent polymorphs, 8 per cent lymphocytes, 6 per cent mononuclears, and 4 per cent eosinophils The Wassermann reaction was negative

On June 9, without any warning and with no aura, he had another fit, followed rapidly by two more, 0·2 gramme luminal was given intramuscularly, and the attacks ceased The following day lumbar puncture was performed The cerebro-spinal pressure registered 180 mm of water The fluid was clear, there was no coagulum on standing, the chloride figure was 660 mg per 100 c.cm, Fehling's reaction was reduced the protein content was 0·06 per cent the cells numbered 2 per c.mm, the gold curve showed no change, cultures were sterile, and the Wassermann reaction was negative At this stage a very slight degree of papilloedema was observed for the first time X-ray examination of the skull on June 12 showed some slight perisutural sclerosis but the sella turcica was normal, and no other abnormalities were detected Perimetric examination revealed normal fields of vision *On June 13 a slight fit was observed and it was* decided to give 1 grain of luminal by the mouth regularly twice a day During the next week the patient did not show any change, except that the papilloedema was becoming a little more obvious There was no vomiting and the other cranial nerves were intact In the circumstances however he appeared to display rather an undue degree of euphoria and was excitable and somewhat restless

On June 20 slight general puffiness and congestion of the face was again observed By the following day this condition was much more evident and cyanosis of the face was marked For the first time there was engorgement of the superficial veins of the neck, upper chest and arms, and a picture of mediastinal pressure was presented On percussion in the intercapsular area there was a slight but definite broadening of the mediastinal dullness to the right X-ray examination showed an opacity coming out from the right hilar area, and the appearances were consistent with those of a new growth In addition there appeared to be some collapse of the lower zone of the right lung, with elevation of the corresponding half of the diaphragm In view of the cerebral symptoms it was decided to obtain pneumoradiographs of the brain, 8 c.cm of air was injected into the lumbar region but the films showed no distension, distortion or displacement of the cerebral ventricles

Deep x-ray treatment of the neoplasm was begun but was discontinued after two exposures because the patient's condition was rapidly becoming worse The venous distension and cyanosis increased daily and the oedema of the face and neck progressed to such an extreme degree that the patient was hardly recognizable The restlessness increased but was controlled to a certain extent by morphine He died on July 3 No further epileptic fits had occurred, and it is interesting to note that there had been a complete absence of cough and haemoptysis throughout the illness

A post-mortem examination was made The brain showed congestive changes, but a careful search for metastases or other gross lesion met with negative results The pericardium myocardium and cardiac valves were normal Ante mortem clot was present in the superior vena cava, which was compressed by the growth A clear yellow pleural effusion was found on both sides The left lung appeared normal and aerated The right lung was adherent on the mesial surface of the upper lobe, where there was a solid mass of growth The right upper bronchus was constricted by the growth which had spread to the right side of the mediastinum forming a solid mass about three inches in diameter No glandular involvement could be detected by the naked eye. Sections of the growth showed a typical bronchial carcinoma of a small round-cell type, which at one point was observed to be infiltrating a bronchus

COMMENT

In reviewing this case I am inclined to accept a *diencephalic* of epilepsy to account for the symptoms which presented

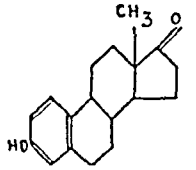
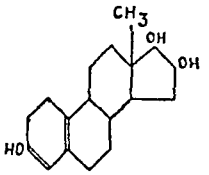
THE CHEMISTRY OF OESTROGENIC COMPOUNDS AND METHODS OF ASSAY

BY



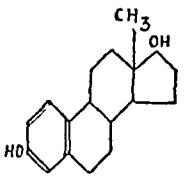
E. C. DODDS, M.V.O., D.Sc., Ph.D., F.R.C.P.

It is difficult to state with certainty which worker obtained the first potent extract of the ovary and of the testis, but there is little difficulty in recognizing the pioneer work from which our present-day exact knowledge has developed.

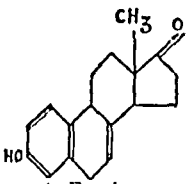


In the case of the ovary the work of Allen and Doisy (1923) can be unhesitatingly quoted as laying the foundation for all the successful work that has been accomplished on this subject. It will be remembered that these workers demonstrated that an active stable substance could be extracted from the ovary which, when injected into castrated rodents, was capable of re-establishing the reproductive or oestrous cycle. Once a stable and uniformly active preparation had been obtained it followed that chemists and biochemists would attempt to discover the actual structure of the active principle. No progress was made, however, in this direction other than to show that it consisted of an organic compound soluble in organic solvents and containing carbon, hydrogen, and oxygen.

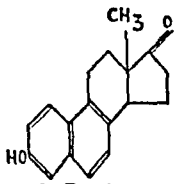
Attempts at purification failed owing to the large number of substances of a similar constitution which were extracted together with the hormone. The next step was made by Aschheim and Zondek (1927), when they discovered that the oestrus-producing hormone was excreted in the urine of pregnant animals. It is excreted in a form very suitable for purification, and since relatively enormous quantities are excreted a large supply of starting material was thus provided for the chemist. The usual chain of events in the establishment of the identity of a compound rapidly followed. The substance was crystallized by Doisy (1929) in America and by Butenandt (1929) in Germany independently, and considerable advance was made with regard to its probable structure. It is not proposed to attempt even a summary of the experimental evidence that can be advanced for the constitution of the oestrus-producing hormone, since this is a matter of pure organic chemistry. It was shown by a number of workers that the oestrus producing hormone is related to the sterols, and it is interesting to note that the constitution of this group of substances had been worked out only a short time before the purification and crystallization of the sex hormones. Unless the structure of the sterols had been discovered no progress would have been made in the work on the constitution of the sex hormones.



Up to the present five oestrus-producing substances have been isolated from either the ovary, the urine of pregnancy, or the placenta. These substances are



1 Oestrone



2 Oestriol

3 Oestradiol

4 Equilene

5 Equilenin

Of these compounds oestrone was the first one to be isolated in crystalline form and was for a considerable time looked upon as being the true hormone of the ovary. By a process of partial hydrogenation it was found possible to convert the ketone group into a hydroxyl group, thereby giving rise to the compound now known as oestradiol. It has been shown that this is some five times as active as oestrone itself, and workers in this field were faced with the rather unusual state of affairs that an artificial substance was apparently more active than the natural one. Later, however, oestradiol itself was isolated from follicular fluid and from the urine of pregnancy, and it is now regarded as being the true hormone of the ovary.

From the clinical standpoint the only compounds which find extensive use to-day are oestrone and oestradiol, and it is interesting to note that oestradiol appears to be assuming major importance in therapeutic use. Equilene and equilenin, though capable of producing oestrus, are not so active and are not available to the clinician.

Standardization

Standardization has presented a great many problems, and despite the successful application by Allen and Doisy (1923) of the vaginal smear method, no thoroughly comparable results were obtained until the crystalline material had been prepared. The process of the method of standardization is to inject subcutaneously a series of castrated rats or mice with the material and by following the vaginal smear to determine whether oestrus supervenes. Every type of unit has been defined, and until recently complete chaos reigned.

To indicate the difficulties of standardization it must be pointed out that the activity of a given sample, even when in crystalline form, depends upon the vehicle in which it is dissolved and the number of spaced injections which are administered to the animal. By giving an aqueous solution (obtained by diluting an alcoholic solution) in a large number of small doses spread over forty eight hours it is possible to enhance the activity to a very remarkable extent. Thus a solution which is inactive when injected in one or two doses will be highly active when administered in, say, six smaller doses. Single injections of oily solutions, again, yield quite different results. From this it can be seen that the old terms of "rat unit" and "mouse unit" really mean nothing except to the actual person who has conducted the test. Further, even though the same method of injecting is used, unless a large number of animals are employed for each test the results will not be reproducible.

An attempt was made to clear up this situation by the Committee on Hormones of the League of Nations Permanent Health Commission. The committee suggested the adoption of a process well established in

themselves in 1919 The momentary attacks of hemianopia were probably of the nature of visual fits and the frequent occurrence of the amnesia, as described, would tend to support the supposition Close interrogation failed to bring to light any epileptic symptom in the interval between that year and the onset of the present illness At the time of the first examination no factor could be discovered to account for the sudden precipitation of further attacks Naturally the patient's occupation aroused certain suspicions, but he stated that he had always taken every precaution against the risk of lead poisoning and this possibility could be further eliminated by the absence of other signs of plumbism

I had to consider other possible toxic causes but he had always been moderate in the use of alcohol, and uraemia was ruled out on the biochemical findings General paralysis of the insane was excluded on clinical examination and the negative Wassermann reaction, together with the absence of change in the cerebro spinal gold curve The diagnosis of idiopathic epilepsy was untenable after the discovery of papilloedema, and a definite intracranial factor was indicated when the lung neoplasm so abruptly presented itself Cerebral tumour was eliminated by all available methods of exclusion and finally by post mortem search

I am driven to the conclusion that the generalized epileptiform convulsions were probably due to the widespread cortical venous engorgement and irritability consequent upon the marked obstruction to the blood return from the head while the limitation in the number of the fits in the later stages of the disease could probably be accounted for by the active anti epileptic measures taken

Leicester RONALD MCD CAIRNS, M D

Acute Idiopathic Intussusception

A rare acute abdomen' was admitted to the Manchester Royal Infirmary recently The patient was a man aged 39 a crane operator by trade, and he was sent in as an undiagnosed urgency case

His history was of five hours duration the pain being sudden and acute in onset followed by vomiting one hour later There were two points of interest in his past history first that he had been in the habit of taking pills for constipation (he had taken one just before the onset of the pain) secondly that a similar attack of pain five days previously had passed off uneventfully The pain was severe, colicky and not localized immediately after the onset a large motion had been passed followed by absolute constipation The patient had vomited about three pints of bile stained fluid

On examination the patient was cyanosed and very restless the tongue dry and furred temperature 96 and pulse 52 The abdomen moved freely on respiration and was slightly distended there was voluntary rigidity and a firm tender elongated mass high in the right iliac fossa *Per rectum* there was extreme tenderness on the right during the colicky spasms but otherwise nothing abnormal On these findings a diagnosis of intussusception probably due to early carcinoma caeci was made

On opening the abdomen an intussusception of ileo colic type was found about five feet of gut being involved reduction was effected without much difficulty but the most careful examination of the bowel failed to reveal any predisposing lesion appendicectomy was performed Uneventful recovery

My acknowledgements are due to Mr Wilson H Hey for his kind permission to publish this case

THE AIM AND SPIRIT OF NEUROLOGY

Neurological Biographies and Addresses Foundation Volume Published for the Staff to Commemorate the Opening of the Montreal Neurological Institute of McGill University (Pp 178 illustrated 12s 6d net) London H Milford Oxford University Press 1936

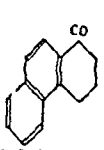
Dr Wilder Penfield and the staff of the recently opened Montreal Neurological Institute of McGill University have had the happy idea of publishing in a Foundation volume the addresses which were delivered as a part of the opening ceremony of the Institute and biographical sketches of leaders of neurological thought written by members of the Institute's staff The opening addresses are on Neurology, by Dr Gordon Holmes Neuro surgery by Dr Harvey Cushing, and The Significance of the Montreal Neurological Institute, by Dr Wilder Penfield The series of biographical sketches begins appropriately with Hughlings Jackson and Victor Horsley and ends with Harvey Cushing

This book will be of interest to neurologists all over the world primarily as an expression of the spirit and aim of this new neurological institute, which is the most recent addition to a famous medical school The breadth of its outlook is illustrated alike by the introductory addresses and by the understanding interpretations offered of the work of past masters of neurology The biographies of neurologists, neuro surgeons, neuro physiologists, and histologists indicate the width of the foundations of neurological research both in the past and at the present day a fact which finds expression in the equipment both human and material of the Montreal Neurological Institute But as Dr Holmes emphasizes in his introductory lecture however wide the foundations must necessarily be it is the physician who is the apex of the structure for it is only the physician who can examine the working, whether it be normal or disordered of the body

The increasing specialization of modern medicine calls for special methods of organization if the specialist is not to lose touch with his colleagues and if the trees are not to be planted so far apart that they never compose a wood It is only by gathering together under one roof a group of specialists who are in constant touch with one another's problems that this difficulty can be overcome Most of the workers whose lives are described in this volume had no such opportunities They were pioneers working in isolation If the scientific world of to day is producing fewer men of this type it is because research owing to the exigencies of modern science has now become a communal activity The recognition of this is the idea which has inspired the creation of the Montreal Neurological Institute and the ideal which finds expression in its Foundation volume

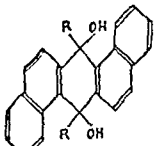
LESIONS OF THE NAILS

Diseases of the Nails By V Pardo Castello M D (Pp 178, 94 figures 16s) London Baillière Tindall and Cox 1936



Dr Pardo Castello has discovered a more or less untilled corner of the field of dermatology Before the publication of this volume there was no monograph on the subject in the English language and the only one of which we are aware was that by Heller published in Berlin in 1927 Students of dermatological literature will recall that for many years before the publication of his

biological assay—namely, that of defining the activity in terms of a standard preparation This method has worked excellently in the past in the case of hormones such as insulin oxytocin, etc and its application to the sex hormones has certainly clarified the issue considerably At the last meeting of the committee a number of standards were laid down The international unit for oestrin was given as 0·1 γ In its use the investigator takes the international standard and finds out the quantity required to produce oestrus in 50 per cent of ovariectomized rats or mice he then determines the amount of the unknown preparation required to produce the same response, and by this means a standardization is effected By this technique the variability of individual animals is overcome and at the same time a control is obtained on the use of solvents spacing of injections, etc



The committee pointed out that since the crystalline pure preparations were becoming more and more easily available the necessity for biological standardization became less and less, and that in time, with accurate chemical characterization weights of crystalline material and not units should be prescribed

By far the most important preparations on the market to day which are employed clinically are the benzoylated derivatives of the hormones The action of these compounds is much more prolonged and gives rise to more lasting effect The greater part of the clinical work has been performed with the benzoylated oestradiol, the esterification occurring at the phenolic hydroxyl group The international standard of this compound is recognized at 0·1 γ This unit although suitable for experimental work on rats and mice, requires very great multiplication before it can be used in human therapeutics Since these hormones act quantitatively in relation to the body weight it necessarily follows that a castrated woman will require many hundreds of thousands of units of oestrone and correspondingly less of oestradiol benzoate in order to effect the menstrual response This gives the impression that very large quantities of hormone are being administered when in actual fact the quantities in terms of weight are only very small It is to be hoped that in the near future agreement will be reached by the commercial firms supplying this material, and that the labels on the preparations and the commercial literature will indicate the milligrammes of crystalline material to be prescribed, thus avoiding the confusion of the biological unit

The fact that there are five naturally occurring oestrogenic compounds all differing slightly in molecular structure leads to the question as to what chemical groupings are actually necessary for the production of oestrus It is interesting to note that a series of synthetic oestrogenic compounds of relatively simple molecular structure have been described (Cook, Dodds Hewett, and Lawson 1934, Cook Dodds, and Lawson, 1936) Molecules as simple as 1 keto 1 2 3 4 tetrahydrophenanthrene, and alkyl derivatives of 9 10 dihydroxy 9 10 dihydro 1 2 5 6 dibenzanthracene are found to be capable of replacing

1 keto 1 2 3 4 tetrahydro phenanthrene

9 10 dihydroxy 9 10 dihydro 1 2 5 6 dibenzanthracene

oestrone in all its known actions Maximum activity is obtained in the latter compound when the alkyl substituent is *n* propyl It is interesting to note that these compounds in common with oestrone and oestradiol all possess the phenanthrene nucleus, and until comparatively recently it was thought that this ring system was essential for the production of oestrus producing properties It has been shown however that this is not the case (Dodds and Lawson 1936, Dodds, 1936) and a surprisingly simple series of compounds have been synthesized capable of producing oestrus The most simple of these is 4 4-dihydroxydiphenyl

It is not possible at present to give an explanation as to why these simple compounds are active nor is it possible to predict the essential groupings for oestrogenic activity There still remains a great deal of work to be done on the simpler oestrogenic compounds before any adequate theories concerning the relation between molecular structure and oestrogenic activity can be formed

INTERNATIONAL CO-OPERATION ON HEALTH QUESTIONS

The report of the medical director of the International Health Office on the work of the session of the Permanent Committee of that body held in Paris last October has now been issued [1] Among the matters discussed was the role of the Office under the projected scheme of reform of the Health Organization of the League of Nations The terms of the new statute provide that the Permanent Committee shall continue to act as general advisory health council of the League and hold an annual assembly of the council at the end of one of its sessions, to which assembly representatives of States which do not participate in the work of the Office will be invited and at which members of the Health Committee of the League will have the right to attend

Venereal Disease in Seamen

The efforts made to ensure continuity and uniformity of treatment in the different ports of seamen suffering from venereal disease seem to be bearing fruit Australia Belgium, Canada and the Dutch colonies of Curaçao and Surinam have now been added to the countries which have notified the Office that the treatment recommended in the recent pamphlet distributed by the Office will be applied in future in their treatment centres

Sanitary Convention for Aerial Navigation

Progress was reported in the designation of aerodromes according to the various categories specified in the International Convention of 1933 and particularly of anti amaril aerodromes It was agreed that the sanitary authority of the aerodrome is competent to decide which of the passengers of an aircraft have been exposed to yellow fever infection

Discussion took place on the recent action of the Government of India in refusing access to its territory to (1) any aircraft within nine days of its leaving a country where the existence of yellow fever has been demonstrated either clinically or by the mouse protec-

[1] Paris Office International d'Hygiène Publique 195 Boulevard Saint Germain

book Heller was in the habit of recording interesting cases of diseases of the nails in the professional journals, most often in the *Zeitschrift für Dermatologie*, and these observations formed the basis of his well-known work Dr Pardo Castello's volume is on much the same lines He has collected examples of practically every variety of lesion which affects the nails, and not the least valuable feature of the work consists of the excellent and numerous photographs with which it is illustrated The pathological changes in the nails lend themselves better than those of other anatomical regions to photographic illustration, since the rendering of colour is quite unimportant as compared with accuracy of form and outline The author has also drawn attention very properly to the large number of industrial occupations in which diseases of the nails are common, and he has provided a very useful table showing the particular form of symptom and the approximate cause of the lesion in each branch of industry affected Another and shorter table gives a list of the chief poisons which cause ungual symptoms and the form that these symptoms take

The treatment of diseases of the nails is notoriously difficult, but Dr Pardo Castello has not failed to give all those methods which may be of service He has produced a very interesting volume, which deserves study by all dermatologists

HEALTH PROBLEMS

Nature Hits Back By Macpherson Lawrie (Pp 180 5s net) London Methuen and Co 1936

Under a not very happily chosen title Dr Macpherson Lawrie has written a book to guide the layman (and, incidentally, medical practitioners too) in the consideration of a number of the most important health problems of to-day Many such books are either commonplace or faddist some are so over-simplified as to be misleading or so unpractical as to be useless Dr Lawrie's book is exceptional, none of these epithets can properly be applied to it The author has a definite point of view, and a very clear and suggestive outlook He regards the health of the man in the street as more important than that of the patient in the hospital He does not, however, minimize the importance of the latter, and he admits that there are many exceptions to his generalizations about the former Thus, subject to these necessary and sensible provisos, his chapters on nervous fatigue and moods of fear and depression, on food and nutrition, on the glands of internal secretion, on child guidance and upbringing, and on sex are not isolated and independent essays, but are connected by a common idea, and by the underlying purpose of placing these subjects in due relation to each other and in what the author regards as a proper perspective with regard to other problems of health and disease

The medical reader will probably find some of Dr Lawrie's pronouncements a little over-emphasized, and a little too dogmatic or unqualified, but faults of this kind are apt to prove virtues when the intention is to impress fundamental points or truths upon the uninstructed and to lead to a practical application of observations and precepts to human behaviour The enormous importance to-day of early attention to what are regarded usually as minor mental disturbances while avoiding a too exclusive psychological outlook, the interdependence of problems of nutrition and those of mental make-up personality, and character, the need for a revised and balanced consideration of the training of children, of adolescence, of sex marriage, and birth control are particular problems with which Dr Lawrie deals To all of them he gives a fresh, consistent, and helpful exposition in a book which can be commended with unusual confidence to the attention of the reading public and to those medical practitioners who wish to know what their patients may be thinking about such matters or to refer them to suitable literature so that they may be encouraged to think and act aright

PHYSIOLOGY AT THE BEDSIDE

Physiological Principles in Treatment By Sir Walter Langdon-Brown, M A, M D, Hon D Sc I R C P and Reginald Hilton, M A, M D, F R C P Seventh edition (Pp 308 10s 6d) London Baillière, Tindall and Cox 1936

This book has proved its usefulness in successive editions since the first publication in 1908 Written with the object of bringing to the mind of advanced students and practitioners those facts of physiology which can be applied in the care and management of their patients it made a popular appeal That much change in physiology and in medicine has occurred in the last quarter of a century is evident, the centre of gravity of medical and scientific problems has altered, so that in the new seventh edition large portions of the book have been rewritten and by rearrangement a clear description of the present day position is obtained In short and fitting words the authors—for Sir Walter Langdon-Brown has again had the assistance of Dr R Hilton—traverse the main paths of modern physiology and seek to apply the knowledge to clinical work Even in the six years since the last edition considerable advances have been made in the domain of endocrine glands—a subject after Sir Walter's own heart —vitamins and the relation of the liver to purine metabolism Other chapters on digestion, heart disease, the kidney, the blood and allergic diseases have been brought up to date In the preface to the first edition the author was uncertain of his physiological views but with the years his experience and judgement have given assurance This is a useful handbook It contains a short bibliography of references for further reading On page 251 and page 255 the well known Price-Jones curves are attributed to Pryce-Jones

COMPARATIVE ODONTOLOGY

Variations and Diseases of the Teeth of Animals By Sir Frank Colyer, K B E L D, F R C S (Pp 750 1 007 figures 42s net) London John Bale, Sons and Danielsson 1936

In the autumn of 1930 Sir Frank Colyer delivered for the Dental Board of the United Kingdom four lectures on "Abnormal conditions of the teeth of animals in their relationship to similar conditions in man" In the present volume a fuller account of these conditions is given with additional chapters on "Variations of the teeth in number and shape," "Abnormal eruption of teeth" "Overgrowth of teeth," and "Odontomes"

In gathering material for his work the author has examined the collections of animal skulls in most of the museums of Europe and America, as well as the collections in public and private museums of Great Britain The help everywhere so willingly given (and duly acknowledged in the preface) is good evidence of the interest the work has roused among zoologists Indeed so far as we know no comprehensive survey of the subject has hitherto been attempted It needed a man of knowledge leisure, and infinite patience to collect the data and co-ordinate their details For many years, both before and since his retirement from practice, Sir Frank Colyer has been curator of the Odontological Museum of the Roy

tion test, unless "disinsectization" by means of pyrethrum extract "pyrocide 20," has taken place either at Cairo or at Alexandria, (2) any persons arriving by aeroplane within the same period, unless they have departed from an anti-amaril aerodrome or have been inoculated against the disease The delegate for India gave the reasons that led his Government to take this step, which requires justification under the terms of Article 48 of the Convention The committee expressed the hope that when the aerodrome at Karachi has been rendered anti-amaril the Government of India will reconsider these measures

Consideration was given to the experiments made at Karachi and Khartum on mosquito destruction in aeroplanes by spraying with liquid insecticides Experiments at Karachi with 'pyrocide-20" have given encouraging results The committee thought that the study of mechanical mosquito preventing devices on aeroplanes should be continued, but that mosquito destruction in aerodromes was the best method of protecting aircraft against infestation from the insects

Yellow Fever Surveys

The yellow fever immunity surveys undertaken in the Caribbean region indicate that in the six islands included in the survey—Cuba, Jamaica, Barbados, Porto Rico, St Lucia, and Trinidad—there has been no infection from yellow fever during the last twenty years In Mexico and Salvador the youngest subjects showing a positive reaction were born in 1925, the last clinical cases occurred in 1921 and 1924 respectively

In the Anglo-Egyptian Sudan there was a high percentage of positive tests in several districts, reaching 78 per cent in Kau It has not been possible to connect these positive tests with the existence in the past of any disease resembling yellow fever In the Belgian Congo striking results were reported In 6 per cent of cases a re-examination of the persons whose sera were negative in 1932 and 1933 gave a positive result, although no disease resembling yellow fever had been clinically detected in the region After an epidemic of infective jaundice which occurred in the region of Libenge near Ubangi, and which could not be identified with yellow fever, the percentage of positive tests rose from 6 (the figure for 1933) to 46 for convalescents and 26 for persons who said that they had not suffered from the disease It is to be hoped that observation and study of such facts as these will one day clear up the mystery of positive protection tests in regions where yellow fever has never been diagnosed

The yellow fever virus attenuated by culture on tissue has now been used, combined with immune serum on more than 900 persons in London, New York, and Rio de Janeiro No untoward reactions were observed

Plague and Typhus

In certain Western States of the USA a mobile laboratory has been used during the past year to locate foci of sylvatic plague, which is more widespread than had been supposed Three additional laboratories will shortly be put into the field In spite of the spread of rodent plague only two human cases have been observed in the regions in question The large-scale trials of anti-plague inoculation, initiated in the Dutch East Indies in 1934 were continued in 1935 It is estimated that, in the districts included in the test mortality from plague will be reduced to 16 per cent of that previously experienced

The causes of the sporadic persistence of typhus in epidemic zones in Poland is the subject of continued study in that country It has been found that lice are more easily infected by typhus patients in the first week of the illness than in the second hence the importance of delousing The Weil-Felix reaction and rickettsia agglutination showed the existence of hidden infection in thirty seven persons in the entourage of patients, but efforts to infect lice or guinea-pigs from the blood of these persons were unsuccessful The part played by hidden infections in the spread of typhus is thus uncertain, a conclusion which was also reached in Tunis No positive Weil-Felix reaction has been found outside epidemic zones or after an epidemic has died out Over 4,000 people have been inoculated against typhus in Tunis The method employed has been devised by Laigret and entails the use of a living rat virus Some febrile reactions have been observed these cases being the only ones to give a positive Weil Felix reaction No cases of typhus occurred after the seventh day following vaccination The period during which the virus can be conserved appears to be very short

Poliomyelitis and Cerebro-spinal Meningitis

The difficulty of comparing statistics of poliomyelitis, owing to the practice in some countries of excluding cases without paralysis was illustrated in communications presented by the delegates for Sweden and the United States of America The committee suggested that delegates should consult their sanitary administrations regarding the possibility of introducing in their countries a system of notification whereby 'paralytic" cases are differentiated from "non paralytic" As regards the epidemic situation more than 2,200 cases were observed in Sweden during the first nine months of 1936, a recrudescence occurred in Norway in August and September, slight outbreaks were reported in some Swiss cantons and a small epidemic at Lisbon

In connexion with the widespread epidemics of cerebro spinal meningitis which have attacked the Anglo Egyptian Sudan in recent years, the committee had asked for information on the disease in other parts of tropical Africa From the communications received it would appear that in 1935 and 1936 British colonies in West Africa were but slightly affected, but the disease is more frequent in Kenya and particularly in Uganda, where 1,629 cases were reported in 1935, with a death rate of 47 per cent In French African colonies cases are usually sporadic in districts of even temperature, but where there are variations of heat and rains epidemics are liable to occur In 1921–4 a severe outbreak caused 15,000 deaths in the Niger and Upper Volta districts The appearance of the rains usually puts a stop to the epidemics Experimental inoculation at Fort Archambault and in the Anglo Egyptian Sudan gave inconclusive results, owing in the former case to the onset of the rainy season The results of prophylactic inoculation in the Anglo Egyptian Sudan with vitamin A appear sufficiently encouraging to deserve further trial

Weil's Disease

Up to the present only about fifteen known cases of Weil's disease have been reported in Poland, usually in connexion with river bathing In Denmark the disease is more frequent than was thought (forty cases in three years) At Copenhagen out of 100 rats twenty four were found to be infected In Holland study of the disease has been continued, chiefly with the help of the Tropical Institute at Amsterdam Of 279 cases examined 106 showed no signs of jaundice, the diagnosis of such cases is difficult In eight cases out of 163 where the bacillus was studied the pathogenic agent was found to be *Lepto spira canicola*, differentiated by Dutch authors from the classical leptospira In Europe three leptospiroses are now known—icterohaemorrhagic, canine, and "typho-grippal" (Schlimann fieber)

Bovine Tuberculosis

Recent research in Amsterdam having shown that the occurrence of bacilli of the bovine type in human pulmonary tuberculosis was more common than had been thought—namely 2 6 per cent in Amsterdam and 11 2 per cent in rural districts—the committee had asked for similar information from other countries In Denmark it appears that the proportion varies directly with the amount of tuberculous infection of the cattle reaching 20 per cent in Jutland, where the cattle are heavily in

Reviews

THE ANAEMIAS

Pathological Physiology and Clinical Description of the Anaemias By William Bosworth Castle M D S M (Hon) and George Richard Minot M D S D (Hon) F R C P Ed (Hon) Edited by Henry A Christian A M M D, LL D Sc D (Hon) (Pp 205 15s net) New York and London H Milford Oxford University Press 1936

The Oxford University Press has paid Dr W B Castle and Dr G R Minot the compliment of republishing their chapter on anaemia for the Oxford Loose Leaf Medicine as a separate volume with the title set out above This little book, with its 163 pages of text and its 646 references, is certainly the best account available for the general physician of the remarkable advances in haematology which have been made during the last decade To the more specialized haematologist and pathologist it is of great interest to be able to read the considered opinion of two men whose work has revolutionized the treatment and clarified the pathology of pernicious anaemia

Much attention is paid to the size of the red cells not only their mean diameter but also their volume and thickness as these data are of much value in diagnosis and classification The enumeration of the immature red cells or reticulocytes long known to haematologists but first popularized by Whipple, Minot and Murphy has proved invaluable in the separation of anaemias due to diminished blood formation from those due to increased destruction and in the observation of the effects of treatment At the same time as he has been making exact determinations on the individual red cell the haematologist has learnt from Boycott to envisage the whole of the circulating red cells and their precursors in the bone marrow as a single organ the erythron The erythron is the largest organ in the body, and it is obvious that to repair the wear and tear of the circulating red cells the marrow must be supplied with adequate materials

An important group of anaemias is due to lack of raw materials for haemopoiesis and this deficiency may be absolute when the diet is at fault or conditioned when the digestion or the utilization of the haemiatinic principles is at fault In pernicious anaemia the deficiency is conditioned by the absence of a specific ferment or intrinsic factor, which is normally present in the gastric juice and the mucosa of the stomach and duodenum The best known of the haematinic principles are the P A factor iron copper vitamin C, and thyroxine The authors suggest that in health when there is an adequate supply of these substances blood formation is regulated by the oxygen tension in the bone marrow The relation of alimentary disturbances to pernicious anaemia and to the hypochromic anaemias associated with iron deficiency is fully discussed Castle and Minot apparently think that infection and an inflammatory gastritis are unlikely explanations of the gastric defect in the majority of people with pernicious anaemia, and they point to McCarrison's studies of the profound changes produced in the alimentary tract by defective diets as offering an alternative explanation A pathognomonic feature of pernicious anaemia is increase in the size of the red cell but the authors believe that macrocytosis is not always the result of a failure in the supply or utilization of the P.A factor They do not accept Wilkinson and Israels's conception of achrestic anaemia but include such cases under the heading of aplastic anaemia many patients with the diagnosis of aplastic anaemia prove to have a moderately cellular marrow after death and the term 'aregenerative is more appropriate even if hybrid The authors also doubt whether there is any connexion between the macrocytic anaemia of liver disease and pernicious anaemia

The spleen remains an organ of mystery It is not clear why it should enlarge in anaemias due to depressed blood formation, such as pernicious anaemia and idiopathic hypochromic anaemia, though it is suggested that this may be an effort to conserve haematinic materials Castle and Minot believe that if other blood dyscrasias such as aleukaemic leukaemia and Hodgkin's and Gaucher's diseases are excluded then splenic anaemia or Banti's disease is always the result of mechanical obstruction of a chronic nature to the venous return from the spleen or the portal system in general It is they say an act of faith rather than of reason to believe in the primary nature of the splenic enlargement They point to the good results obtained by symptomatic treatment especially with massive doses of iron Splenectomy may improve health by removing a large abdominal tumour and it may lessen the risks of haematemesis by diminishing the portal blood flow but it is in no sense a specific cure for the anaemia or a reliable prophylactic against haemorrhage These views are undoubtedly shared by the majority of the younger school of haematologists and there has thus been a complete reversal of opinion on the need for splenectomy in Banti's disease

FINGERPOSTS TO GENERAL PRACTICE

An Introduction to General Practice By E Kaye Le Fleming M A M D (Pp 150 5s net) London Edward Arnold and Co 1936

It is perhaps natural to expect that the medical man whom the British Medical Association chooses as Chairman of its central Council should be of mature wisdom and tried experience as well skilled in affairs as in purely professional matters but it need not follow that as in the case of the present chairman Dr E Kaye Le Fleming he should also have the pen of a ready writer and the command of a limpid lucid English style such as few of our profession attain to His *Introduction to General Practice* designed for senior students and the newly qualified will be of the greatest value to those circles but there can be few seniors whether general or special practitioners who will not profit by a perusal of it In simple terms incapable of misconstruction he sets forth a lofty ideal of what the general practitioner should aim at and how he should set about realizing his aims Our Chairman's thirty five years in practice have been years of momentous changes in the medical care of the people and his survey of these changes and of the prospects of further change shows a capacity for vision of larger issues not always to be found in those who are themselves in the hurly burly of startling events

Apart from the sections on national health insurance hospitals and clinics the functions of the General Medical Council medical defence societies and similar topics the most individual note is struck in the advice as to the handling of patients the avoidance of misunderstandings and all that goes towards the formation of a bedside manner This is all admirable both in matter and in tone though there are cynics who may question Dr Le Fleming's advice to tell the patient in simple language the reason of his malady and the method and purpose of the remedies Certainly the old saw that there are no intelligent patients so that it is futile to appeal to their intelligence contains quite a large enough modicum of truth to be worth bearing in mind None however are likely to disagree with his criticism of the reluctance of the individual to raise his eyes from the ambit of his own practice and to face the great issues which are slowly

but surely *shaping the destiny of himself and his successors, and his still greater reluctance to play his part in moulding the future of medical practice'* One could multiply quotations from almost every page of this short book, which everyone about to embark or recently embarked upon general practice should read and re-read on partnership work alone there is a chapter well worth the price of the whole book

To point out tiny slips seems almost ungracious amid such a feast of excellence, but in a second edition it might be well to alter the statement that the doctor in attendance at a birth has to register it within thirty-six hours, when in fact his duty is confined to notification Nor is it, we think, correct that he alone is liable to penalty for failing to notify, though the law may be a dead letter in respect of the others on whom the duty is laid A redraft of a sentence to draw the distinction between puerperal fever and puerperal pyrexia might also be worth while, as also of another to make it clear that non-members of the B M A may utilize the services of the Medical Insurance Agency But such few and trivial blemishes serve, by contrast, to show up the high level of excellence of a book from which patients as well as doctors will derive lasting benefit—if they are fortunate enough to come across it

SALPÊTRIÈRE SURGICAL PROCEDURES

Techniques Chirurgicales By A Gosset (Pp 433 219 figures Broche, 105 fr , cartonné, 125 fr) Paris Masson et Cie 1936

This volume contains a full description of the renowned surgical clinic of the Salpêtriere and of the chief surgical procedures upon which its fame has been built Professor Gosset became surgeon-in-chief at the Salpêtrière in 1913, and seven years later transferred to that clinic the whole of the surgical work of the Hôpital Necker, so that we have here a record of continuous work extending over a period of twenty-three years As the hospital contains 350 beds and is one of the busiest surgical centres in Paris the record is of very special surgical importance, and this is increased by the care which has been given to its accurate presentation

The volume opens with an account by Professor Gosset himself of the surgical service at the Salpêtriere and a very full account of the methods of sterilization adopted This is followed by a description of the pathological department by its director, including important details as to the method of photomicrography which he adopts, and especially the use of infra-red light for this purpose A series of short but valuable articles follows, devoted to anaesthesia, to trigeminal resection, to cancer of the superior maxilla, and to diaphragmatic hernia Two chapters of very high value are contributed by Dr Charrier and Dr Loewy on gastrectomy for ulcer and for cancer respectively Professor Gosset contributes an article on appendicitis to which his wide experience gives a peculiar value, and this is followed by a useful article on intestinal obstruction Two of the best chapters in the book are by Dr Jean Gosset and Dr Leibovici on the treatment of cancer of the colon and the volume concludes with contributions on fibroids and on the treatment of club-foot

The articles are without exception, of a very high level of excellence and they are written with a thoroughly practical outlook Their presentation and illustration might well arouse the envy of any surgeon Not only do the illustrations reach a very high artistic level but they are so skilfully constructed that it would be quite possible to appreciate all the more important points considered without knowing a word of French We regard the volume as a very important addition to surgical literature, both as representing the long service of a famous clinic and as setting forth the successful practice of a most distinguished group of surgeons in some difficult and important branches of surgery

A MONTESSORI BOOK

The Secret of Childhood By Maria Montessori, M D, D Litt Translated and edited by Barbara Barclay Carter (Pp 279 7s 6d net) London Longmans, Green and Co 1936

The name of Dr Maria Montessori is well known to all who are interested in childhood, and this book gives a brief account of her views and her experience It is a popular account intended for parents and teachers rather than a scientific exposition, yet the scientific worker, whether medical or psychological, may find pleasure and profit in a *credo* resulting from years of patient observation and devoted service The book is divided into three sections, dealing in turn with early child development, the author's educational method, and the relation of the child to society The first of these sections is an excellent example of how good an account can be written of a very difficult subject in simple language, suitable for any layman, and with a complete avoidance of psychological technicalities or pseudo psychological jargon

The most interesting part of the book is the second where, again in the simplest of language, the account of the first "Casa dei Bambini" sets forth the essence of the Montessori method The casa started in the humblest fashion, an attempt to keep slum children from damaging tenement property rather than a school, there was little money and no trained staff, and Dr Montessori, herself quite inexperienced, came to it with the determination to learn from the children rather than to make them learn from her Wherein lies the whole kernel and essence of the Montessori method observing, helping, suggesting, rather than teaching or forcing The adult, Dr Montessori claims, must play a negative part, all is free and open for the child, he chooses his own materials, and learns from them because they interest him An American psychologist has said, 'Seventy-five per cent of what we teach children you couldn't prevent them finding out for themselves' One has only to watch a small boy mending a bicycle, or "tinkering" with a wireless set to see how mechanics are most easily learnt, yet most of us can remember the dreadful boredom with which we struggled with the theoretical elements of the subject As well expect the shuttle on the loom to be interested in the completed pattern as expect a normal boy to connect the fascinations of machinery or of mechanical toys with the dull diagrams drawn—smudgily—on graph paper in his classroom Given the method of free interest, we are told, the need for punishment, and even for reward, fades out Relieved from the emotional strain of competition and of fear the child becomes stable confident, and happy These are children as they should be, and Dr Montessori claims, not that her children are given extra help, but that children educated in the orthodox schools are abnormally handicapped What Dr Montessori does not stress is the strain which the application of such a method imposes on the patience and wisdom of the teacher To act is always easier than to observe, and it is fatally easy to teach a class a set lesson by a set method Yet from what we know of the psychology of childhood we may confidently assert the dangers of set lessons and set methods for young children, and we must pay tribute to Dr Montessori, who formulated her principles empirically

fected For Germany, England and Wales and Scotland the figures were 0 7, 1 4, and 4 9 respectively

It seems from the statistics that countries with a low incidence of tuberculosis of bovine origin are Norway, India and Japan, with a medium incidence Germany and Switzerland, with a high incidence Great Britain The cause of the high incidence in Great Britain is doubtless the heavy infection of milk with the bovine bacillus Since the eradication of tuberculosis in cattle is hardly possible reliance must be placed on efficient pasteurization

Ankylostomiasis

The incidence of hookworm infestation in the United States appears to be limited to mining areas in about six States and to certain rural areas of the South In France a great diminution has been found since the inquiry undertaken in 1904–7, infestation is now apparently confined to certain mines in the Loire area In Hungary three out of thirty three mines and in Spain one mine and at least one rural area in Murcia were found to be affected In Tunis the mining population appears to be free, but a heavy infection of the native population in four cases was discovered

It is concluded that ankylostomiasis is not a serious disease in Europe for persons living under good hygienic conditions The majority of mines are either free or very lightly infected Certain foci of infection still remain, however, in which a vigorous campaign against infestation is required

Mental Hygiene

Contributions to the study of the classification and education of backward and abnormal children were presented by the delegates for Great Britain, Canada, France and Rumania

The British report gave a full summary of the measures taken for the education of mentally defective children as the outcome of the Royal Commission report of 1908 and the subsequent legislation based on that report In its broad outline the organization in Canada follows that of England, and it is estimated that half the backward children in the country are receiving suitable treatment In order to encourage doctors to devote more attention to the mental health of the population the schools of medicine are to give a larger place in their curricula to the study of psychiatry and mental hygiene

A comprehensive summary shows that the problem of the backward and abnormal child has been studied in France since the beginning of the century There are a number of special schools both day and residential for backward children throughout the country but there is as yet no official system for ascertaining or classifying such children Schemes for dealing with abnormal children are of more recent date and are consequently less well developed but as regards difficult children the Ecole Theophile Roussel at Montesson is obtaining good results Rumania possesses four State institutions capable of receiving some 600 abnormal children of all categories Morally abandoned children are cared for by two private societies one of which possesses a school where the children can receive professional training The Penal Code of 1936 provides for the treatment and cure of delinquent children on modern lines

The committee decided to continue the study of this subject at the next session under the aspect of the cause and prophylaxis of mental backwardness

---

In connexion with the first International Congress of Pyrotherapy to be held at Columbia University New York from March 29 to 31 those who propose to contribute to the discussion on pyrexia treatment in paediatrics are asked to send summaries of their papers to Dr G Blechmann, 30, Avenue de Messine Paris VIII Fees for the congress and requests for more detailed particulars should be sent to the general secretary Dr Andre Halphen, 222 bis, Rue Marcadet, Paris, XVIII

JOHN HUNTER, ARMY SURGEON

LECTURE AT ROYAL COLLEGE OF SURGEONS

A special lecture was given by Professor GEORGE E GASK at the Royal College of Surgeons of England on February 15 on John Hunter in the Campaign in Portugal, 1762–3 A short time ago there came into the market and was acquired by the College a bundle of MSS the property of John Campbell, Earl of Loudoun who commanded the British expedition to Portugal at the end of the Seven Years War This campaign was quite an unimportant side show, with practically no fighting and military historians dismissed it in a few words but Lord Loudoun though not conspicuous for military genius had the merit of being tireless in matters of documentation which accounted for the preservation of the papers As some of the documents relate to John Hunter they have a special interest for the College and to Professor Gask was given the duty of arranging them

John Hunter, said the lecturer quite early in life seemed to have thought of a military career When he came to London in 1748 at the age of 20 he wrote that if he could not help William he would not mind going into the Army Ultimately, in 1760, he did enter the Army possibly for health reasons obtaining an appointment as staff surgeon in the expedition to Belleisle and when the campaign in Portugal was organized he was sent with four foot regiments to Lisbon as one of the surgeons for the military hospital Professor Gask exhibited a list of the hospital staff The director was William Young who received 25s a day and there were two physicians William Cadogan and Michael Morris who received 20s and three surgeons John Hunter, William Maddox and Francis Tomkins, who only received 10s There were also two apothecaries and sixteen surgeons mates Another list gave the names of the servants attached to the hospital and it was specially interesting to note that these included a staff of nurses The matron was remunerated at the rate of 2s 6d a day, the two head nurses at 1s the same rate of pay as was received by the three cooks and the five washerwomen but the pay of the fifteen nurses was only 6d It might come as a surprise to some that nurses should have been attached to a military hospital at this period One theory was that the nurses were really camp followers—that is wives of the soldiers—but in Professor Gask's view all the evidence went to show that these women were recruited in London probably from the voluntary hospitals, and sent out to Portugal They were not of course trained as nurses nowadays were expected to be trained but they were nevertheless professional women

Documents from the Campaign in Portugal

Among the documents exhibited was one from Lord Loudoun addressed to the director of the hospital ordering him and the staff to repair to Portsmouth for embarkation on the hospital ship *Betty* which was to be convoyed to Lisbon Another was a return of the sick on board this boat during the voyage the number being thirty four On arrival at Lisbon the hospital was established in four houses It was remarked by the adjutant general that though the hospital was rather overstaffed none of the nurses could be discharged as their places could not be filled in emergency The discipline of the hospital was set out on a sheet of standing orders and was an iron one—the term black hole was even mentioned among the penalties Hunter who had a Scottish solicitude with regard to his pay applied for the position of deputy director but, in fact that post was never filled Later on Cadogan one of the physicians being invalided home he applied for the vacant post— I take the liberty to recommend myself and I hope the following reasons will plead my excuse —but he did not get the appointment Loudoun being unwilling to lose the services of a good surgeon

other chemists on the list and it will not be able to limit its dispensing even if it so desired to its own in patients or out patients

On Sending a Patient to Hospital

If an insurance practitioner is of opinion that his patient ought to be sent to hospital either for better nursing or for special treatment which he is unable to give he would be expected to take the same amount of care in arranging for the patient's transfer to hospital as he would in the case of one of his private patients On the other hand it has been a frequent subject of complaint on the part of general hospitals that some insurance practitioners have been too ready to send their patients into hospital when there was no reasonable ground for thinking that the patient could not be adequately treated at home It is hardly necessary to say that a doctor cannot wash his hands of a case if a patient refuses to avail himself of hospital treatment Here are two extracts from reports of cases in one of which the practitioner was censured for neglect and in the other it was established that there had been no neglect

1 It was with unusual candour that the practitioner told us that if a patient is not prepared to accept his advice in any respect this automatically concludes his relations with the patient The practitioner seemed to be unaware of the fact that whatever he may do in his private practice there is a definite obligation upon him to provide treatment for an insured patient, and that a practitioner cannot rid himself of the obligation by advising removal to a hospital The offence of discontinuing the treatment of a patient becomes a matter of gross negligence when the practitioner in the first place gives no warning of the fact that he has washed his hands of the case and secondly ignores an urgent request to visit

2 It is quite clear that the practitioner gave indications on more than one occasion that the case was one for hospital The subsequent history bears out the impression which we formed that the insured person was disinclined to avail himself of hospital treatment even when pressed to do so by the tuberculosis officer and the health visitor The period covered by the incidents giving rise to the question is only three weeks the first application for the practitioner's services having been made on April 6 and another practitioner having been called in on April 27 During that time the practitioner had visited the patient four times and while he was suspicious of the development of the illness we accept his statement that it was not until April 24 that he regarded it as other than one of the characteristic bronchial attacks to which the insured person was subject In our view the charge of neglect has not been established While expressing every sympathy with the widow we are satisfied that there is no evidence that the practitioner failed to exercise proper care and skill in his treatment of the insured person

Emergency Treatment in Hospital

If a patient needing emergency treatment is taken to a hospital or infirmary and the insurance doctor giving the treatment is on the hospital staff it will be held that the treatment is not given by the doctor in his capacity of insurance practitioner, and he is not therefore enabled to claim payment from the Insurance Committee for the service—that is in those areas where emergency treatment is paid for separately out of the practitioners fund (Where it is not paid for separately the question does not arise) The position would be otherwise at a cottage hospital or other institution which had no medical staff and which local doctors used for the treatment of their private patients

Timely Admission to Hospital

The Regulations define negligence as including among other forms of failure, failure to advise the patient as to the steps that should be taken to obtain treatment which is not within the scope of the Terms of Service This might include for example, failure to secure the patient's timely admission to hospital in a case of emergency

Visiting a Patient in Hospital

It would be as well to state although this may be implied from what has already been said that the practitioner's general obligation to visit a patient when his condition requires it extends to any cottage hospital or similar institution in which the general practitioners of the area have the right to visit their own patients

Certification of Incapacity

The following statement on this subject will be found at page 115 of *Medical Insurance Practice* (fourth edition)

There is a danger in the wording of Rule 18 which states that you are not under any obligation to issue certificates for a patient who is in hospital because it seems to imply that you may issue a certificate if you wish to do so But Rule 18 must be read in conjunction with Rule 9 and with the wording of the certificate itself You cannot issue a certificate except as the result of an examination of the patient on the date entered in the certificate It follows that you are not allowed to issue a certificate for a patient who is in hospital and whom you have not had an opportunity of examining It is an invariable practice for approved societies to accept as evidence of incapacity a statement by an official of a hospital that the insured person was an in patient between the material dates and the question of a certificate in these circumstances from the insurance practitioner should not therefore arise

Hospital Staffs

These notes would not be complete without reminding practitioners that hospital staffs are commonly allowed where they are provided with medical attendance by the governing body to make their own arrangements for medical benefit The problems which arise for the insurance practitioner in this connexion have on occasion been referred to in these notes

*** If any practitioner has experienced any difficulty in connexion with hospital treatment which is not covered by these notes it would be appreciated if he would communicate with the Medical Secretary B M A House Tavistock Square W C 1 when an endeavour will be made to provide him with a clear statement of his responsibilities

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Lieutenant Commanders T A Cochrane and G Rorison to the *President* for course C B Nicholson to the *Pembroke* for Royal Naval Barracks

Surgeon Lieutenant J L S Coulter to be Surgeon Lieutenant Commander

Surgeon Lieutenant M G H Heugh to the *Excellent*

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenants C Seeley and D M Dean to be Surgeon Lieutenant Commanders

ROYAL ARMY MEDICAL CORPS

Captain W H Hargreaves half pay list has been restored to the establishment

Lieutenant (on probation) F T Moore has been confirmed under the provisions of Article 413 Royal Warrant for Pay and Promotion 1931

ROYAL AIR FORCE MEDICAL SERVICE

Flying Officer D S MacL Macarthur to be Flight Lieutenant

Flying Officer G B MacGibbon to R A F Station Scampton

Professor Gask showed a map of the campaign The British force advanced along the Tagus and took its stand at Santarem, where a base hospital was established Among the various documents collected were sick lists, but it was remarkable that among the casualties there was no mention of a wound One return showed the sick list of the 83rd Regiment, and Professor Gask ran through the diseases—asthma fever, pain in the head, flux, diarrhoea, swelling in the legs, and so on, "the age long complaints of the Army" The letters from Hunter to the commander-in chief concerned routine matters of administration, such as arrangements for transport, evacuation of the sick, and the like One document set out his proposals for a temporary or flying hospital They appeared to be very sensible ones succinctly expressed, and such as, Professor Gask thought, would be acceptable to any director-general to-day The idea that Hunter could not write a letter and had to get his letters written for him was finally disposed of by this correspondence He was undoubtedly perfectly competent to write a good precise letter They were business communications, not remarkable for literary style or epigram but he was a very faithful correspondent of the commander-in-chief

Another common idea about John Hunter was discouraged by this correspondence—namely that he was a quarrelsome, contentious individual From some of the letters it appeared that fierce disputes arose between his fellow surgeon Francis Tomkins and more than one of the surgeons mates, and in the expostulatory letter written by one of the mates complaining of Tomkins's high handed conduct over a small dereliction it was mentioned that Mr Hunter was present and no doubt would be prepared to verify the facts, but that he took no part in the dispute, the matter being one which did not concern him

By the middle of November, 1762 an armistice had been declared, so that there was no further fighting The subsequent papers were concerned chiefly with the return of the expedition to England In one letter John Hunter was asked to send in a statement as to how many boats would be required to evacuate the sick The final document was a list of the officers, Hunter among them who had served from February 10, 1762, to May 14, 1763, with their pay sheet Hunter, who had taken the opportunity while in Lisbon to carry out experiments on the organs of hearing in fishes, returned to London retired from the Army on half-pay, and, according to G C Peachey's *Memoir*, found his way first of all to the house of Robert Home, whose daughter Anne he married eight years afterwards

THE HUNTERIAN DINNER

On the evening of the same day the Hunterian festival dinner was held at the College, the guests being received by the President, Sir Cuthbert Wallace, and the vice-presidents, Sir Charles Gordon-Watson and Mr Victor Bonney After the "Memory of John Hunter" had been toasted in silence Sir Cuthbert Wallace referred to the recent deaths of two great surgeons Sir John Bland-Sutton and Lord Moynihan former Presidents of the College, who strangely dissimilar in character, had both advanced surgery in the Hunterian tradition In the course of a brief tribute to John Hunter Sir Cuthbert noted the life-long curiosity of the man, using that word in its best sense to mean his wish to find out how things worked Another characteristic was his diligence he was a whole-time man who worked morning noon and night and when stricken with mortal illness made himself the object of his own observations The College museum was Hunter's monument Such an institution could not stand still like Hunter it must go forward in research It was the duty of the College to keep abreast of surgery of the day while at the same time illustrating the development of surgery in the past The Buckstone Brown farm had been a great step forward and the gift from the Bernhard Baron trustees of £25 000 for new laboratories at the College had now been increased to £30,000, so that the flame received from John Hunter might be kept burning brightly at the headquarters of British surgery The toast of "The Guests" was proposed by Sir Charles Gordon-Watson, who welcomed among others five of the Hunterian trustees, the treasurers of the four Inns of Court, the Dean of Westminster the Medical Directors of the Navy, Army, and Air Force, the President of the Royal College of Surgeons of Edinburgh and eight Masters of City Companies including two medical men, Dr Stanley Bousfield and Dr Arthur Gibbons This distinguished company, he said, had assembled to pay tribute to the pioneer of scientific surgery, whose career was enshrined within the walls of the College Sir Arthur MacNalty, Chief Medical Officer of the Ministry of Health, replying to the toast, gave a message of regret for his absence from the Minister, Sir Kingsley Wood He pointed with satisfaction to the increasing contact between surgery and preventive medicine since the time of John Simon, who was President of the College while doing pioneer work in sanitary reform Sir Farquhar Buzzard proposed the health of the Hunterian Orator of 1936, Mr C H Fagge, who briefly acknowledged the toast, and after dinner a series of cinematographic films were shown in the lecture theatre and in the council room was an exhibition of pictures, prints, and drawings of the College buildings

Reports of Societies

TREATMENT OF FACIAL PARALYSIS

At a meeting of the Medical Society of London on February 8, with Sir William Willcox *presiding*, the subject for discussion was the treatment of facial paralysis Short reels of cinematograph film illustrating the technique of operations or the results of treatment were shown by Sir Harold Gillies, Mr Terence Cawthorne, and Mr Dickson Wright

Aetiology and Prognosis

Dr Macdonald Critchley said that to the neurologist the treatment of facial paralysis could be summarized in three words massage, electricity, and facial splint The end-results were often diverse, notwithstanding similarity of treatment He limited his remarks to Bell's palsy Traditional teaching postulated an acute inflammatory swelling of the nerve trunk and its interstitial tissue as a result of cold, with subsequent strangulation of the nerve A proportion of the cases of Bell's palsy were due to the operation of a neuro-fixating virus, of herpes or some other variety but the majority were probably not virus infections The occurrence of second and third attacks was frequent enough to render unlikely any universal operation of a neurotropic virus Some looked upon Bell's palsy as the result of two aetiological factors the effect of cold coupled with some focus of infection in the vicinity It would be safest to regard the condition as a symptom which might have more than one cause As for the results of treatment it was believed that good end results were obtained in 80 or 85 per cent of all cases It had been suggested that pain and loss of taste were important prognostic features in the early stages Most cases of the Gowers-Ramsay Hunt syndrome did badly, while other virus affections of the facial nerve did very well Between these extremes lay the majority of cases of palsy of obscure origin Clonic facial spasm was a very common sequel of Bell's palsy The treatment consisted of massage and manual stretching of the muscles in contraction Facial synkinesis or involuntary associated facial movements also often developed He asked for suggestions for treatment of the acute cases of Bell's palsy where clinical judgement or the electrical reactions

Election of Member of Council

Dr. Isaac Jones (London, W.1) has been returned unopposed to represent the South Australian, Tasmanian, Victorian, and Western Australian Branches on the Council of the Association for the remainder of the period 1935–8.

G. C. ANDERSON,
Medical Secretary

Proposed Central Provinces Branch

Notice is hereby given by the Council of the Association to all concerned of a proposal made by members of the Association resident in the Central Provinces of India that a Central Provinces Branch be formed of area coterminous with that Province.

Any member affected by the proposal and objecting thereto is requested to write to the Medical Secretary by May 20, 1937, stating the objection and the ground therefor.

CHARLES HILL,
Deputy Medical Secretary

February 20, 1937

Scholarships and Grants in Aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships as follows: an Ernest Hart Memorial Scholarship, of the value of £200 per annum; a Walter Dixon Scholarship, of the value of £200 per annum; and three Research Scholarships each of the value of £150 per annum. These Scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease. Preference will be given, other things being equal, to members of the medical profession. Each Scholarship is tenable for one year, commencing on October 1, 1937. A Scholar may be reappointed for not more than two additional terms. A Scholar is not necessarily required to devote the whole of his or her time to the work of research, but may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment do not interfere with his or her work as a Scholar.

Grants

The Council of the British Medical Association is also prepared to receive application for Grants for the assistance of research into the causation, treatment, or prevention of disease. Preference will be given, other things being equal, to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine.

Conditions of Award. Applications

Applications for Scholarships and Grants must be made not later than Saturday, May 8, 1937, on the prescribed form, a copy of which will be supplied on application to the Medical Secretary of the Association, B.M.A. House, Tavistock Square, London, W.C.1. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

Katherine Bishop Harman Prize

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize, of the value of £75 in the year 1938. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best essay submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any medical practitioner registered in the British Empire is eligible to compete.

Should the Council of the Association decide that no essay submitted is of sufficient merit, the prize will not be awarded in 1938, but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each essay must be typewritten or printed in the English language, it must be distinguished by a motto and accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address. Essays must be forwarded so as to reach the Medical Secretary (to whom inquiries may be sent), B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1937.

Branch and Division Meetings to be Held

BATH, BRISTOL AND SOMERSET BRANCH. BATH DIVISION.—At Royal United Hospital, Bath, Wednesday, February 24, 8.30 p.m. B.M.A. Lecture by Sir Ewen Maclean: "Occipito-Posterior Positions."

DERBYSHIRE BRANCH. BUXTON DIVISION.—At Devonshire Royal Hospital, Buxton, Thursday, February 25, 8.15 p.m. Dr. J. W. A. Hunter (Manchester): "The Female Sex Hormones."

DORSET AND WEST HANTS BRANCH. BOURNEMOUTH DIVISION.—At Boscombe Hospital, Wednesday, February 24, 8.15 p.m. Dr. James Maxwell: "Abscess of the Lung."

GLASGOW AND WEST OF SCOTLAND BRANCH.—At Institution of Engineers and Shipbuilders, 39 Elmbank Crescent, Glasgow, Wednesday, February 24, 8.30 p.m. Professor James Hendry: "Recent Developments in Midwifery Practice."

KENT BRANCH. BROMLEY DIVISION.—Joint Meeting with Bromley Medical Society at White Hart Hotel, Bromley, Wednesday, February 24, 8.45 p.m. Dr. Clement Nicoll: "The Value of Physical Methods in the Treatment of Disease." Preceded by supper at 7.45 p.m.

suggested that no good end result was likely Should treatment proceed by physiotherapy as usual or should decompression of the facial nerve be done?

Plastic Operations

Sir HAROLD GILLIES (who took the place at short notice of Mr T P Kilner) said that plastic operations for the face were a most indifferent operative procedure as compared with what—at least he hoped—was produced by nerve grafting and decompression operations It was when the face was completely "dead that the plastic surgeon found his opportunity, and for his own part he felt himself to be a kind of facial undertaker At the same time these fascial slings which were put into the face must appeal to the mind as surgical splints of a more efficient character than the usual mechanical aids employed and they might be a means of preventing in some cases the over stimulation by electrical treatment of a muscle which was already knocked out' He thought that in a case with a bad prognosis the advisability of fascial slings should be considered The operation of putting them in was comparatively simple, its complications were not serious and if the nerve did recover then the bands would have done nothing but accelerate such recovery Facial paralysis in a young person presented a most distressing picture and however disappointed he himself might be in the cosmetic result the patients themselves were invariably delighted with the result of the operation The support of these slings seemed to be greatly appreciated and in the comfort given by such support the patients overlooked the efficiency of the operation from an æsthetic point of view It should not be impossible to develop an association between two groups of muscles so that when a person bit his food he smiled instead of making the grotesque movements which often accompanied the act of mastication The two movements could not be far away, and might be associated Sir Harold Gillies then showed a film illustrating the plastic operation in a case of paralysis following mastoid disease Fascia lata was taken from the thigh, and strips used in remodelling the face

Nerve Grafting

Mr TERENCE CAWTHORNE said that although most cases of facial palsy recovered there remained an unfortunate minority which, by the very nature and extent of the lesion causing the paralysis, could never recover of their own accord It was with this latter class of case that the surgeon was concerned Until recently the most favoured operation was anastomosis of the distal end of the divided facial nerve The results were not very encouraging and a satisfactory return of facial movements could only be expected by exposing the nerve at the site of injury and attempting to restore anatomical continuity One of the pioneers of facial nerve surgery was the late Sir Charles Ballance (the discussion was taking place on the first anniversary of Sir Charles Ballance's death) who performed the first anastomosis operation, he believed over forty years ago Later on Duel in New York evolved a special technique

In considering facial paralysis the result of operative trauma early exploration was indicated in all suspected cases and restoration of continuity should be effected by direct apposition of divided ends The degree of recovery after facial graft largely depended upon the interval between the injury and its repair If the paralysis was not noticed immediately, but went on gradually and possibly was never complete, the likelihood was that such a case was one of slight injury and resultant oedema which would recover spontaneously Cases of palsy that were going to recover completely on their own did not as a rule entirely lose the faradic response The loss of faradic response a week after paralysis indicated a severe lesion with the improbability of a complete spontaneous recovery The first essential step was exposure of the nerve at the site of the injury Then and not until then, the surgeon would be in a position to say what further treatment if any was required to restore the continuity of the damaged nerve If, as was sometimes the case, especially when some interval had elapsed between the time of injury and the time of exploration there was a considerable gap after the severed ends had been freed of tissue, a graft would be necessary Ballance and Duel had shown that the only material worth consideration for bridging the gap was a piece of living nerve By using degenerated graft Ballance and Duel also found that they obtained better and speedier results than by using fresh nerve grafts It had been thought until recently that the graft should be the same size as the nerve but it had been found that two or three strands might give better results than one thick graft A graft as long as 26 mm had been used with successful results The results of the Ballance and Duel nerve graft operation had been remarkably good Most of the reported cases had recovered emotional as well as voluntary movement Even in the worst cases where a long interval had elapsed between the injury and the graft, a considerable degree of voluntary movement could be expected Residual paralysis as a result of pressure on the nerve either from without the sheath or from within might be prevented by decompression in some cases

Suture of Facial and Hypoglossal Nerves

Mr DICKSON WRIGHT mentioned that he had had good results in two cases of decompression of the nerve in footballers who had sustained injury by a kick on the mastoid process In clonic facial spasm the operation of decompression was suggested to him by Dr Duel, and he tried it in three cases but in none of the three was the clonic spasm affected at all, so that he thought that operation could be ruled out as being of any value in the treatment of clonic facial spasm There were a certain number of cases in which the Ballance–Duel operation failed and a certain number of cases of facial paralysis arising from intracranial tumours in which that operation held out no hope The operation expounded by Sir Harold Gillies was indicated as he himself had said for 'dead cases—cases without any power of return in the muscles In between the Ballance and Duel graft and the temporal muscle plastic operation came the operation of suture of the twelfth hypoglossal nerve and the facial nerve and he showed a film of this procedure with some very good results

General Discussion

Mr CECIL WAKELEY said that he had the pleasure of working with Sir Charles Ballance for ten years at the West End Hospital for Nervous Diseases where the operation was carried out on fourteen of these cases, with good results in twelve In some the mastoid operation had been done three years previously In certain of the later cases the hypoglossal nerve was taken and split half of it only being used and just as good a result was obtained as when the whole was used and the paralysis of the tongue was almost minimal

Mr HAROLD KISCH said that he had had experience of four of these cases, two of which were of too recent date to report upon and the other two were successes One woman aged 23, treated after radical mastoid operation had shown no recovery until after nearly eighteen months In this case there was suppuration at the time the graft was inserted He thought that both Duel and Ballance claimed that recovery could be obtained in the presence of suppuration Questions on the technique of grafting were put by Mr DONALD WHEELER Dr LIVINGSTONE and others

Dr MACDONALD CRITCHLEY in reply said that he was not yet clear as to the indications for operative intervention in these cases of Bell's palsy Mr Cawthorne had said that loss of faradic response towards the end of the second week might be taken as such an indication and that was the usual teaching, but he understood that

LANCASHIRE AND CHESHIRE BRANCH SOUTHPORT DIVISION—At 52 Hoghton Street Southport Friday February 26 8.30 p.m. Film of B.M.A. World Tour 1935 Commentator Dr. R. Stewart

LINCOLNSHIRE BRANCH KESTEVEN DIVISION—At St. Peter's Hill Grantham Tuesday February 23 3 p.m. Consideration of adoption of resolution under the ethical rules of the Division Address by Mr. R. J. McNeill Love Abdominal Emergencies in General Practice

LINCOLNSHIRE BRANCH LINCOLN DIVISION—At Albion Hotel Lincoln Thursday February 25 8.30 p.m. B.M.A. Lecture by Sir William Willcox The Medico-Legal Aspects of Medical Practice

METROPOLITAN COUNTIES BRANCH LEWISHAM DIVISION—At Lewisham Hospital Tuesday February 23 3.45 p.m. Clinical meeting

NORTH OF ENGLAND BRANCH BISHOP AUCKLAND DIVISION—At Bishop Auckland Cottage Hospital Friday February 26 8 p.m. Election of officers consideration of adoption of resolution under the ethical rules of the Division lecture by Mr. C. Gordon Irwin (Newcastle upon Tyne) Manipulative Surgery

SOUTH WALES AND MONMOUTHSHIRE BRANCH SWANSEA DIVISION—At Central Hotel Swansea Thursday February 25 B.M.A. Lecture by Dr. William Evans Angina Pectoris Its Problems and Treatment Preceded by supper at 8 p.m.

WILTSHIRE BRANCH SWINDON DIVISION—At Victoria Hospital Swindon Wednesday February 24 8.30 p.m. B.M.A. Lecture by Mr. R. J. McNeill Love Modern Developments in Surgery

YORKSHIRE BRANCH GOOLE AND SELBY DIVISION—At Londesborough Arms Hotel Selby Tuesday February 23 7.45 p.m. Supper 8.30 p.m. Film and demonstration of treatment of fractures with cellona plaster

YORKSHIRE BRANCH SCARBOROUGH DIVISION—At Scarborough Hospital Thursday February 25 8.30 p.m. Dr. James Davidson (director Metropolitan Police College Laboratory Hendon) Wounds from Firearms and the Examination of Projectiles

TABLE OF OFFICIAL DATES

March 20 Sat	Nomination Papers available (on application at Head Office) for election of (i) 22 Members of Council by Grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
April 7 Wed	Council
April 24 Sat	Publication of Annual Report of Council in *B.M.J. Supplement* Last day for receipt at Head Office of Nominations (i) by a Division of not less than 3 Members for election of 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) for election of 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
May 8 Sat	Publication in *B.M.J. Supplement* of list of Nominations for Election of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body Voting Papers posted from Head Office where there are contests in above elections Applications for B.M.A. Research Scholarships and Grants must be received at Head Office by this date
May 10 Mon	Motions by Divisions and Branches for A.R.M. Agenda on matters of which two months notice must be given must be received at Head Office by this date
May 15 Sat	Publication in *B.M.J. Supplement* of Motions and Amendments by Divisions and Branches for A.R.M. on matters of which two months notice must be given Representatives and Deputy Representatives must be elected by this date Last day for receipt at Head Office of Voting Papers for election where there are contests of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 4 representatives of Public Health Service in Representative Body
May 29 Sat	Publication in *B.M.J. Supplement* of result of election of Members of Council and result of above elections Nomination Papers available (on application at Head Office) for election of 11 Members of Council by grouped Representatives
June 2 Wed	Council
June 3 Thurs	Names of Representatives and Deputy Representatives must be received at Head Office by this date
June 19 Sat	Publication of Supplementary Report of Council in *B.M.J. Supplement*
June 29 Tues	Other items for inclusion in A.R.M. printed Agenda must be received at Head Office by this date

All arrangements for the booking of rooms in hotels are in the hands of Messrs. Thomas Cook and Son Ltd. Royal Avenue Belfast to whom all applications for hotel accommodation should be sent

there were a good many exceptions to it and that cases in which there was true reaction of degeneration at the end of the second week might make a good recovery, while cases which seemed to have their faradic response at the end of the first fortnight did not necessarily make such a recovery Sir HAROLD GILLIES said that the clear indication which the opener had emphasized still appeared to be wanted He questioned whether grafts should be inserted in the presence of suppuration Mr TERENCE CAWTHORNE said that Ballance and Duel laid it down as their experience that suppuration was no bar to successful nerve grafting His own experience had been too short to be of any value, but in three of his cases there had been a certain amount of suppuration, and he got a fair amount of facial movement back He felt very uncertain about the position of faradic response in Bell's palsy

MENTAL DISORDER AND THE ENDOCRINES

A special discussion on the relation between mental disorder and the activities of the endocrine glands took place at a combined meeting of the Sections of Psychiatry and Medicine of the Royal Society of Medicine on February 9 Dr T A ROSS was in the chair

Testicular Hormone

Dr F L GOLLA said that none of them had come prepared to defend a pathogenesis of mental disorder based on diseases of the ductless glands, to say that diseases of the ductless glands were associated with various forms of mental disorder, or that such disorder could be improved by the administration of extracts or implantation of ductless glands There was no evidence of that sort In every mental hospital the experience was that disorders of the ductless glands were fewer than in the world outside A further question was how far the symptomatology of mental disorders was influenced by disorders of the ductless glands Again there was very little evidence Not much was known about hormonic influences on the central nervous system It might be that there were all sorts of structures capable of passing on internal secretions of whose functions they were quite unaware Recent work had suggested that there were nerve cells in the diencephalon which had a secretory function and by inference it might be assumed that the secretion was exactly that attributed to the posterior and possibly the anterior lobe of the pituitary But there was not the faintest evidence so far as he was aware of any particular form of secretory disturbance accompanying any particular form of psychosis The variations in function noted in the insane were probably paralleled by those noted in the sane There was, however one structure—namely, the gonadal system, particularly the testicle of the male—which would respond even to the violent procedure of the histologist and in the end would still show the disturbance of structure which it might be assumed was accompanied by a disturbance of function associated with the mental disorder labelled schizophrenia He showed the slides of the microscopical appearances as obtained by the late Sir Frederick Mott and said that Mott's work on the testicle afforded an objective proof that a mental disorder was associated with a profound bodily disturbance of a specific kind not found in any other disease

For some curious reason nobody seemed to have given these observations of Mott the attention they deserved Their importance was very great to those of them who believed that in many mental disturbances a general bodily disturbance was being dealt with one of the symptoms of which was a disorder of conduct (he would not use the term disorder of mind) This was found associated with a profound disturbance of the endocrine system Could one go any further than this? If the whole of the male sex organs of an animal were ablated and a testicular implantation was made into the castrated animal it would sometimes exhibit normal sexual behaviour, the conclusion being that the testicular hormone had a particular affinity with the nerve mechanism responsible for the sexual act That this nerve mechanism could be acted upon by an endocrine secretion was the only proof in endocrinology so far as he knew which gave any support to the theory of the action of the endocrine organs directly on the nerve mechanism In the case of the pituitary many things which were suggestive were found but it could only be said that the pituitary appeared to act as a general driver on of the endocrine system, it was under the guidance of the pituitary and who was to say which was the primary source of disturbance—the diencephalon or the pituitary?

The supposed relations of endocrinology to the psychoses were conditioned a great deal by an entirely wrong idea of how the central nervous system functioned It was the most labile structure imaginable, if it could not get a thing executed in one way it would get it executed in another It was capable of infinite variety of accommodation to any form of disorder, and although an endocrine disorder could be imagined as causing a general loss of excitability or generalized hyperexcitability, he for his part found it very difficult to imagine that any particular form of endocrine disorder known or unknown, could excite or depress any particular function of the central nervous system

Reciprocal Relationship of Endocrines and Brain

Sir WALTER LANGDON-BROWN sent a contribution which was read in his absence by Dr Levy Simpson He said that in the sphere of character and mental attributes there was less dogmatism as to the primary importance of the endocrines than a decade ago This was largely due to the recognition of the role of the diencephalon in expression of emotion on the one hand and its connexion with the pituitary gland on the other while the pituitary had become recognized as the intermediary between this emotional centre and the other endocrine glands Thus not only could the endocrine make-up influence the emotional state but the emotions could influence the endocrines Evidence of endocrine disorders in mental hospitals hardly suggested that they were a common cause of the psychoses The relation between endocrine dysfunction and mental disorders had probably been overrated, especially in view of the frequent occurrence of endocrine disorders were more often associated with the psychoneuroses than with the psychoses, and here the sequence of development and the favourable results of correcting the endocrine disorder suggested that the glandular condition was sometimes primary There was no doubt that a direct connexion between glandular dysfunction and mental disturbance was clearer in the case of the thyroid than in that of any other gland The untreated cretin was placid and adaptable, just as the sufferer from an excess of thyroid was irritable and intransigent In advanced myxoedema melancholia was not infrequent, but acute mania might occur Hector Mackenzie's description of Graves's disease as a state of continued fear was an illuminating one and nearer the truth than could be realized at the time For whatever the psychical origin in an individual case the predominant feeling was one of fear, masked though it might be The causes of Graves's disease were sex, sepsis and emotional stress, and the discovery of the pituitary thyrotropic hormone suggested a possible mechanism for the third factor via the hypothalamus

Dyspituitarism might be characterized by a sense of inferiority, feeble inhibitions emotionalism fantasies, amoral conduct and sometimes confusional insanity In Addison's disease the patient might be negative and inert Virilism resulting from adrenal cortex tumours or hyperplasia might result in loss of modesty maternal instinct and normal libido the last being occasionally replaced by homosexual instincts Insanity from diabetes had practically disappeared with the introduction of insulin Hypoglycaemia, either spontaneous or from insulin over

Meetings of Branches and Divisions

Aberdeen Branch

A meeting of the Aberdeen Branch was held on December 18 1936 when in addition to members there were present representatives of public health committees insurance committees, boards of management of voluntary hospitals, and others interested Dr W S C Coleman delivered a British Medical Association Lecture on The Fight Against Rheumatism Dr Copeman briefly outlined some of the sociological aspects of the problem and then discussed the institutional application of physical methods in the treatment of chronic rheumatic disease The methods employed and the results obtained at the British Red Cross Clinic were described and illustrated in a number of excellent lantern slides Professor David Cambell and Professor L S P Davidson contributed to the discussion and on the motion of Dr Thomas Fraser a hearty vote of thanks was accorded Dr Copeman for his address

Birmingham Branch West Bromwich and Smethwick Division

At a meeting of the West Bromwich and Smethwick Division held at West Bromwich on January 21 the secretary Dr J M Mitchell reported that he was in negotiation with the Birmingham Branch and hoped to be able to arrange instructional classes in air raid precautions at a later date

By the courtesy of Messrs T J Smith and Nephew Ltd a film was shown dealing with the functional treatment of fractures and the use of cellona plaster of Paris bandages A demonstration was also given of the rapidity with which cellona bandages could be applied and their general efficiency

East Yorkshire Branch

At a meeting of the East Yorkshire Branch, held at Hull on January 13 Dr S F Fouracre delivered his presidential address on A Medical Man in Mesopotamia Some Clinical Experiences in the Tropics and Their Application to Temperate Climates' The address was illustrated by lantern slides made from photographs taken by the president during his stay in Mesopotamia Discussing heat stroke Dr Fouracre said the aetiological factors predisposing to heat pyrexia were a maximum shade temperature of 110° or over particularly if continued for several days, a high bulb temperature causing excessive humidity and increasing the difficulty of cooling the body by perspiration a stagnation of air and any disease causing pyrexia (sandfly fever, etc) Only a few cases occurred when a man was exposed to the sun—that is, the disease was due to the infra-red and not to the ultra-violet rays A patient's temperature would suddenly rise to 108° to 113° thus necessitating rapid treatment to bring the temperature down to 102° Experience had taught them that there were three premonitory signs suppression of sweating frequency of micturition, and a strange manner Various methods were tried to induce sweating—pilocarpine produced salivation but no perspiration Ice packs, cold water sprays, wet sheets, etc, were used Venesection was of no use Recent work showed that the sweat glands could only secrete salt water and not water alone This suggested that when the blood chloride fell to a certain minimum secretion of sweat ceased In support of this was the fact that native races in Central Africa who might be considered liable to heat stroke ate large quantities of salt It was known that sea captains had cured heat stroke in stokers by making them drink sea water Modern treatment included intravenous saline injections and a regular amount of salt in the diet On the motion of Dr John Morrison seconded by Mr C H Corbett a hearty vote of thanks was accorded to Dr Fouracre for his address The company then adjourned for refreshments provided by the president

Egyptian Branch

At the annual general meeting of the Egyptian Branch held on January 21 Group Captain F C Cowtan R A F M S was elected president and Dr R A Gardner honorary secretary for the coming year The Branch rules were amended to correspond with the formation in 1935 of the Sudan Branch to fix the time of taking office of the Branch council and to adopt the Association rules of procedure in ethical matters Colonel R Priest and Major A G Harsant at the conclusion of the annual meeting spoke of some interesting cases of disease they had recently treated and a discussion then followed in which many members took part Later the members attending the meeting were the guests of Colonel Hinkston and the R A M C Citadel Officers Mess

Essex Branch North East Essex Division

At a meeting of the North-East Essex Division, held at Colchester on January 15 it was reported that no objection was raised by Headquarters to the proposal that the Division should hold joint meetings with the Colchester Medical Society the expenses of such meetings to be shared Four joint meetings have been arranged for 1937 It was agreed that a course of evening lectures on the treatment of air raid casualties should be held in the out-patient hall of the Essex County Hospital Mr R W Reid agreed to undertake the local arrangements in connexion with the Treasurer's Cup golf competition, and it was provisionally decided that the Divisional stage should be played at Mersea on May 9

Kent Branch

At a meeting of the Kent Branch held at Canterbury on January 27, with Surgeon Rear-Admiral B Pickering Pick in the chair the secretary, Dr Thomas A Clarke reported upon the progress of anti-gas lectures in the county It was announced that Dr G C Evans was the successful entrant in Kent for the Melbourne Chess Cup Competition Mr L E H Norbury read a paper on "Some Recent Advances in the Treatment of Conditions of the Anus, Rectum, and Colon,' and demonstrated some interesting specimens

Kent Branch East Kent Division

A meeting of the East Kent Division which was preceded by an informal dinner, was held at Cliftonville on January 28 when Mr W E C Wynne was in the chair Dr Geoffrey Evans read a paper on 'The Value and Limitations of Rest in the Treatment of Disease Dr Evans emphasized the value of peaceful as distinct from disturbed sleep and the importance of resting the mind as well as the body Rest though a valuable prescription might be dangerous if carried to excess and not suitably alternated with activity There was a good discussion and Dr Evans replied to a number of questions The meeting closed with a hearty vote of thanks to Dr Evans, proposed by the Chairman, for his interesting paper

Kent Branch Rochester Chatham and Gillingham Division

A special clinical meeting of the Rochester, Chatham and Gillingham Division was held at the Royal Naval Hospital Chatham, on January 20 when Dr H J Hoby was in the chair A series of interesting clinical cases were demonstrated x ray and microscopical films were arranged for examination and an outfit for the administration of evipan and pathological specimens was also on view Papers were read by Surgeon Lieut Commander A Long on 'The Uses of Evipan Anaesthesia' and by Surgeon Captain J G Danson on 'Lumbar Pain At the close of the meeting the Chairman proposed a vote of thanks to Surgeon Rear Admiral B Pickering Pick and the medical officers at the hospital for providing such an interesting meeting

Kenya Branch Mombasa Division

At the annual general meeting of the Mombasa Division held at the Native Civil Hospital Mombasa on January 11 with Dr S D Karve in the chair, the report of the honorary secretary and the financial statement for 1936 were received and approved The Chairman paid a tribute to Dr A U Sheth for his efficient and satisfactory work as honorary secretary and treasurer of the Division during the year

The following officers were elected

Chairman Dr Karve *Vice Chairman* Dr M T Shah
Honorary Secretary and Treasurer Dr Sheth

It was decided that the honorary secretary should see the port manager and make the necessary arrangements in connexion with first aid classes

North of England Branch Tynesidi Division

At a general meeting of the Tyneside Division held at Tynemouth Infirmary on January 19 Dr R J Weidner was elected vice chairman in place of Dr H Adams resigned Dr S C Somer agreed to act as golf secretary in connexion with the Treasurer's Cup golf competition

Mr W E M Wardill (Newcastle upon Tyne) gave an interesting address on 'The After results of Cleft Palate Operations Mr Wardill proved with the aid of the gramophone his claim to be able to provide perfect speech for patients operated upon under the age of 2 years

SOUTHERN BRANCH ISLE OF WIGHT DIVISION

A special meeting of the Isle of Wight Division was held at Newport on December 3 1936 with the object of promoting public interest in air raid precautions Invitations had been sent to the lord lieutenant of the county justices of the peace members of the county and town councils officials of the local branch of the British Red Cross Society the British Legion and members of the medical dental and nursing professions and of other organizations The chairman of the Division Major General J W WEST presided and over 200 people were present Major STUART BLACKMORE of the Air Raid Precautions Department of the Home Office spoke on the organization of instruction classes in measures of defence against gas attack As a result of this meeting the secretary of the Division Dr H S Howie Wood arranged three courses of lectures for members of the nursing profession at the Royal Isle of Wight County Hospital Ryde the Royal National Hospital for Consumption Ventnor and the Isle of Wight County Mental Hospital Newport and a special medical course at the Albany Barracks Parkhurst The courses consisted of six lecture demonstrations each of two hours duration and included practical experience of gas masks in the gas chamber at the barracks Fifty five doctors and 150 nurses and midwives attended the course The speaker was Colonel H R BATEMAN and his lectures were much appreciated To ensure that doctors were provided with textbooks the honorary secretary purchased the necessary publications and sold over 350 booklets at the lectures The expenses of the course were borne by the Division and no charge was made for attendance at the lectures

SOUTHERN BRANCH PORTSMOUTH DIVISION

A meeting of the Portsmouth Division was held at Southsea on December 4 1936 when the guests included Judge Lailey and Sir Harold Pink and local members of the legal profession In the unavoidable absence of Sir Thomas Inskip Mr F G ALLEN consented at very short notice to read a paper *on testamentary capacity* There was a *good discussion* and Admiral LECGATE thanked the members of the Division on behalf of the guests On the motion of Mr SPARKS seconded by Dr J A D RADCLIFFE a hearty vote of thanks was accorded Mr Allen for his address

The annual supper-dance of the Division was held at Southsea on January 15 when some 450 members and guests were present A supper-dance is an annual social event in the activities of the Portsmouth Division and the proceeds are devoted to medical charities About £1 000 has been raised in this way *The success of these functions is due to* an energetic organizing committee and especially to the joint honorary dance secretaries Dr H H Warren and Dr Mearns Fraser

STAFFORDSHIRE BRANCH SOUTH STAFFORDSHIRE DIVISION

At a meeting of the South Staffordshire Division held at Wolverhampton with Mr G F HAYCRAFT in the chair the Division unanimously adopted a binding resolution to the effect that *no medical practitioner in the area of the Division* should apply for or accept an appointment under the Wolverhampton Friendly Societies Medical Association as the terms and conditions of such an appointment are *contrary to the* best interests of the medical profession The meeting considered a memorandum from the Public Medical Services and after a *discussion on the section dealing with ante natal and* maternity services a small committee was appointed to draw up a general practitioner ante natal and maternity services scheme for the district Other sections of the memorandum dealing with infant welfare school clinics immunization and voluntary hospital services were also fully discussed

It was arranged that Dr R H H Jolly should supply all practitioners in the area with a list of registered nursing homes The practitioners in turn would notify him of any unregistered nursing homes which came to their notice A committee was appointed to discuss with Dr Jolly the scheme drawn up by him under the Midwives Act 1936 A further committee was appointed to deal with the scheme which may be drawn up by the county of Stafford

SUDAN BRANCH

Meetings of the Sudan Branch were held in the Kitchener School of Medicine Khartum on November 9 and December 14 1936 The president Dr E D PRIDIE was in the chair at both meetings

On November 9 Dr Pridie welcomed as the guests of the evening Miss Hills Young Mr R K Winter and Mr D C Cumming and then went on to refer to the great loss sustained by the Branch by the retirement of Sir Robert G Archibald its first president The secretary was instructed to convey to Sir Robert Archibald its best wishes for his future career and its deep sense of loss

Dr H RICHARDS read a paper entitled *A Study of Native Diets in Khartum* The *rations issued in the Central Prison* the Reformatory and the Gordon Memorial College were studied A comparison was made between the estimated dietetic value of these rations and approved standards in other countries It was pointed out that the different conditions in the Sudan made the application of standards derived from temperate lands impracticable The effect of the diets in maintaining the health and physical efficiency of the communities concerned was considered It was emphasized that clinical criteria constituted the sole method of adjudging the adequacy or otherwise of the diet Suggestions as to the augmentations of the rations in these institutions were offered

The discussion was opened by Dr R KIRK who emphasized the fallibility of standards and insisted that even the results for one community could not be applied to another He suggested that palatability or at least consistency with dietetic habit should be considered a further postulate for a satisfactory diet The suggestion was made that some trace deficiency disease might be a guide as to suitability of a diet under such artificial conditions as existed in ships prisons etc or in large cities it was not a criterion to apply to the population generally because (1) it was not accidental deprivation of one element but the gradual operation of imperceptible factors particularly in combination which was of importance from the public health point of view, and (2) owing to racial dietetic adaptation deficiency might exist without producing the flagrant symptomatology of the text books It was pointed out that while the compiling of standard diets was interesting populations had known for centuries what to eat The question was whether they could obtain it or not Population always tended to overflow the limits of its subsistence and any factor which increased the latter tended to be reflected not so much in dietetic change as in a rise of population Similarly any factor which reduced *the available subsistence was reflected in a declining popula*tion due not merely to deaths from starvation or deficiency disease but to many other factors like abortion infanticide celibacy unnatural practices till the population finally became balanced against its subsistence at the new level

A vote of thanks was accorded to Dr Richards for his interesting and stimulating paper

On December 14 the president again welcomed Mr Winter as the guest of the evening

Dr J F E BLOSS read a paper on Medical Conditions and Diseases in the Sudan during the Eighteenth and Nineteenth Centuries A discussion followed in which Dr RICHARDS PRIDIE and BLAND took part and a vote of thanks was accorded to Dr Bloss for his interesting paper

STIRLING BRANCH

A meeting of the Stirling Branch was held at Falkirk Infirmary on February 3 when a number of cinematograph films were shown of the latest methods in use in the treatment of fractures at the fracture clinic of the Bristol Royal Infirmary A demonstration of the uses of cellona plaster bandages followed and most of the members took part in the discussion that followed

UNITED PROVINCES BRANCH

A clinical meeting of the United Provinces Branch was held at King George's Medical College Lucknow on November 27 1936 when Captain K S NIGAM was in the chair A large number of final year students and the medical staff of the college and hospital were present by special invitation The CHAIRMAN showed two cases The first was of multiple fibrocystic disease of bone in a woman aged 25 The lesions were present at the lower end of the radius of both forearms as well as in the tibia Blood calcium was within normal limits *Other tests of parathyroid efficiency* were under investigation The second case was of sarcoma of the ileum in a boy aged 15 in which the onset of the disease with fever pain and swelling was not unlike acute osteomyelitis

At a clinical meeting of the United Provinces Branch held at King George's Medical College Lucknow on December 21 1936 with Captain K S NIGAM in the chair Captain R D ALEXANDER showed a case of renal calculus in a girl aged 8 in which the urine examination showed the presence of *B typhosus* The chief complaint of the patient was extreme frequency of micturition The CHAIRMAN showed a case of appendicular abscess in a child aged 10 probably secondary to *Amoeba histolytica* infection

NOTES OF THE WEEK

Remuneration of Insurance Practitioners

A formal request has been conveyed on behalf of the Insurance Acts Committee to the Minister of Health for an increase in the capitation fee the increased capitation fee to be applicable to all insured persons including those shortly to be brought into medical benefit under legislation promised by the Government

Kent Midwifery Scheme

The Kent County Council has prepared a municipal midwifery scheme which provides for the employment of 106 midwives The council has also made arrangements with affiliated nursing associations for the employment of 116 district nurse midwives with unaffiliated associations for the employment of five and with the Margate Borough Council for the employment of four

Public Education in Health

The Stratford Division of the British Medical Association recently convened a conference of representatives of the medical profession local authorities insurance committees and hospitals in the area for the purpose of discussing public education in health The principal speakers were Sir Henry Brackenbury who submitted to the conference the policy of the B M A on the subject and Dr H C Boyde, the honorary secretary of the Stratford Division who proposed that all the interested organizations in the area should co operate in the preparation of a scheme of propaganda The question of finance presented some difficulty but it was hoped to make the scheme self supporting After a useful discussion it was arranged that a report of the proceedings should be sent to all the authorities and committees represented in order that the subject might receive their further consideration

Worthing Contributory Scheme

As a result of negotiations between the Worthing Hospital Board and the honorary medical staff the former has agreed to reduce the income limit of the Worthing Hospital Contributory Scheme to the level recommended by the B M A

Barratt Maternity Home, Northampton

The Board of Governors of the Barratt Maternity Home Northampton has decided that in future accommodation at the home shall be available only to abnormal cases patients referred to the home by their own doctors for a particular reason such as unsuitable home conditions and private patients referred by their own doctors

---

The Dorset County Council has submitted to the Ministry of Health a scheme for the introduction of the principle of free choice for public assistance patients

Sir A R Cook president of the Uganda Branch of the Association is one of two representatives chosen by the Government of Uganda to attend the Coronation

Dr F C Ralphs has been appointed a county coroner for Lancashire

Dr J Young who has retired after thirty eight years practice in Bonnybridge Stirlingshire has received a presentation from his patients and friends in the district

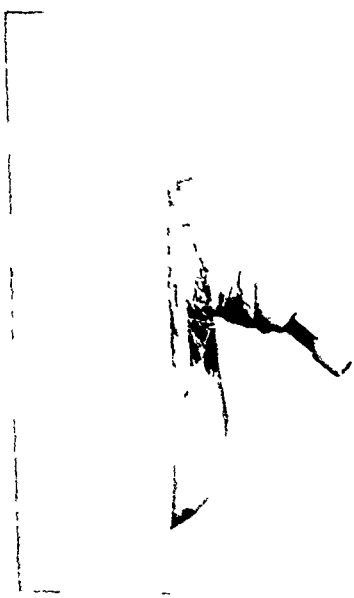

FIG 7.—Showing correction of ventral curve

FIG 8.—Final result after end to end anastomosis. Note normal appearance of meatus

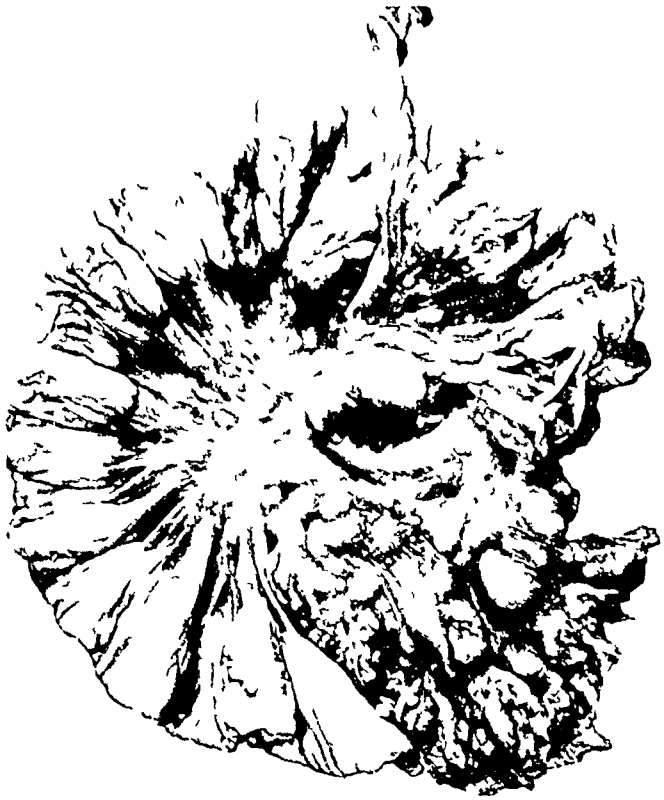
THE DEVELOPMENT OF PROVIDENT ASSOCIATIONS

One of the problems which confronted the middle classes of post-war society was the difficulty of making provision for the cost of illness which necessitated a surgical operation or other treatment in an institution These persons did not belong to the class for which the voluntary hospitals were intended, but on the other hand, they could not afford to pay at the time of illness for long or expensive treatment In several parts of the country attempts were made to solve the problem by means of contributory or insurance schemes, the benefits of which included in-patient treatment at nursing homes or private hospitals, and, in some cases, assistance towards the cost of specialist services

The relation of the medical profession to these schemes was first submitted as a subject for the consideration of the British Medical Association by the Brighton Division in 1923 and in the following year the Annual Representative Meeting adopted a policy for contributory schemes for private patients This policy recommended that the income limit for any scheme should be such as was approved by the majority of the medical profession resident in the area concerned that patients should be permitted free choice of doctor that the medical profession should be represented on the governing body, and that the fees of medical specialists for work performed under the scheme should be assessed on the terms customary in the area These recommendations did not indicate fully the attitude of the profession towards the schemes, for it was believed at that time that the provident movement was not likely to expand to any great extent in the near future, the schemes that had been formed being regarded as business propositions rather than as a development which would materially affect medical practice

Growth of Movement

Although these recommendations continued to form part of the Association's policy, it was not until the end of 1932 that an increasing number of requests for advice on the subject of provident associations prompted the Hospitals Committee to consider the implification of the profession's attitude towards contributory and provident schemes for the middle classes It was evident that the idea of insurance against the cost of institutional treatment was gaining favour Many of the schemes were meeting with success although in general the organizers of urban schemes had not discovered how to combine such benefits as would prove attractive to middle class persons with a subscription rate which would raise sufficient funds to meet hospital maintenance costs and medical fees Much of the work of organization depended of course upon insurance and actuarial principles but it was clear that if the movement was to be promoted throughout the country it was the duty of the organized medical profession to associate itself with new schemes to ensure that in their medical aspects they developed along lines in accordance with professional principles To the purpose therefore of determining the nature of the problems involved in the operation of provident schemes and a future course of action the Association convened in May 1933 a conference of representatives of various interested organizations



The few schemes in existence at this time varied greatly in principle Some were organized in connexion with particular hospitals, and offered to persons with incomes below a prescribed level cover for maintenance charges and either cover for professional fees or a specially reduced scale of fees Others were wider in scope they prescribed no income limit, they were not associated with any particular institution, and they allowed the patient free choice of hospital or nursing home and of medical attendant The benefits of the schemes were usually of the nature of grants in aid of hospital and professional charges The aspects of the subject in which the medical profession was most nearly interested were the class of person insured and the nature of the medical and surgical benefits afforded It seemed very necessary, especially during the experimental period, that there should be close co operation between the organizers of schemes and the organized medical profession

Policy of Association

The conference of representatives appointed a committee to collect information on existing schemes to advise on the formation of new ones, and to prepare a model memorandum and articles for a provident association The committee duly prepared the model constitution, which was approved by the Representative Body, and to it were attached some notes as a guide to organizers of new schemes These notes define the aim of a provident association as the organization and development, on a mutual insurance basis, of a scheme offering persons of the middle classes with defined income limits in return for a prescribed premium, financial assistance in respect of (*a*) the cost of institutional accommodation in private beds attached to voluntary or council hospitals or in beds in nursing homes including all nursing and the use of operating theatre, x-ray plant, laboratory, and other institutional equipment, and (*b*) the cost of associated professional services

It is recommended that the benefits of the schemes, which should be considered and developed in close association with the organized medical profession, should be made available to as wide a group of persons as possible within the limits of the class for which they are intended, and that they should not be organized in relation to a restricted group of medical practitioners or to particular hospitals or nursing homes Such freedom facilitates co operation between schemes and permits interavailability of membership and benefits The notes also contain recommendations that members should be permitted free choice of doctor and approved institution, that patients should be admitted to the benefits of the schemes only on the recommendation of a private practitioner, except in case of emergency, and that medical practitioners rendering service should be remunerated on the basis of a schedule of charges agreed upon by the provident association and the medical profession Associations are recommended to co-operate with the hospitals and nursing homes in the district for the purpose of providing private bed accommodation in preference to undertaking to reserve beds Finally the notes contain some detailed suggestions for income limits, rates of subscriptions, institutional fees, and fees for various professional services In dealing with the question of administration it was suggested that the governing body of a scheme should include representatives of the subscribing members of hospitals in the area, and of the local medical profession and that schemes should eventually be administered through area associations, which in their turn should be members of a National Federation of Approved Associations

Co ordination of Schemes

A second conference at which twenty provident asso ciations were represented was held in March 1936 Since the date of the first conference many new schemes of different types had been inaugurated in both urban and rural areas and although the work done was still largely experimental it had become evident that there was a public demand for provident associations The conference believed that the movement had now pro gressed sufficiently far to warrant the formation of a central co ordinating body of provident associations While local variations in subscription and benefit must exist to a certain extent it is in the best interests of all concerned that uniform standards should be adopted as far as possible and that local associations should have some means of keeping in touch with developments in other areas These ideals may best be promoted by the establishment of a national body which would have the functions of co ordinating the operations of individual local associations and providing advice and information on provident associations generally The conference therefore appointed a committee to prepare a draft scheme for the constitution of such a permanent co ordinating body The committee has now completed its work and the draft scheme will be considered by a further meeting of the conference on March 4

Some Typical Schemes

In view of the variety of schemes at present in existence some details of the main types may be of interest

The Oxford and District Provident Association is open to any person resident in Great Britain but the majority of members live in Oxfordshire or Buckinghamshire There are two classes of benefit The first is offered to any person in return for a subscription in accordance with a scale ranging from £2 15s a year for a single person to £7 10s for a person with four dependants The privileges include a contribution not exceeding £5 a week towards maintenance at a nursing home or hospital for a period up to five weeks and a contribution not ex ceeding a prescribed amount for surgical operations con sultations with specialists deep therapy and other special medical services The liability of the association is limited to £50 in any one year and to £50 in respect of any one operation or illness For the second class of benefit an income limit is prescribed ranging from £350 for a single person to £500 for a member with three dependants and it is available only in cases where treatment is given in the nursing home or private bed in a voluntary hospital A payment not exceeding £5 a week is made towards hospital treatment for a period up to four weeks and contributions are also made towards the cost of surgical operations medical specialist and non operative surgical cases specialists consultations and certain additional medical services The association's liability is confined in this case to £40 in any one year and to £40 in respect of any one illness

The Birmingham Hospitals Contributory Association organizes an Extended Benefits Scheme for persons in the district above the ordinary hospital class Three grades of benefit are offered, the first providing in any one year a sum not exceeding £16 towards the cost of treatment in hospital pay-wards, private hospitals or nursing homes, the second a sum of £22 for a similar purpose, and the third £28 The subscriptions for the three grades are respectively 6s 6d 9s 9d and 13s a quarter, and they include benefit for wholly dependent relatives of the contributor No payment is made for medical attendance the fees being arranged privately between doctor and patient The Addenbrooke's Hos pital Provident Scheme offers free treatment in the pri ate wards of the hospital for a period up to four consecutive weeks and medical and surgical treatment by members of the honorary medical staff of the hospital The sub scription is £2 for a member and his dependants and there is an income limit of £350 for a single person and £500 for a husband and wife with an additional £ for each dependant

The British Provident Association prescribes no limit of area or of income and it offers three alternative schemes in return for a prescribed annual subscription Scheme I includes payments towards the cost of main tenance in a hospital or nursing home the fees of a registered nurse required to reside at the patient's own home the fees for a consultation either at the patient home or at the specialist's consulting room half the cost of treatment at the Radium Institute up to a maximum of £40 and a grant towards the cost of an ambulance The benefits of Scheme II include those of Scheme I plus a contribution in accordance with a schedule of fees towards the cost of surgical operations Scheme III offers the privileges of either Scheme I or II plus a contribution towards the fees of a consulting physician in daily attend ance upon a case of serious illness in a hospital or nursing home

General Practitioner Treatment

The medical benefits ordinarily provided by provident associations are limited to specialist services rendered in institutions but the question has been asked whether the scheme could be extended to include ordinary general practitioner service The Council of the B M A accord ingly considered at the request of the Annual Repre sentative Meeting [illegible] the desirability of [illegible] definite and limited [illegible] on the treatment given by them and reported its opinion that the proposal in the form suggested did not on actuarial grounds appear to be practicable at present It should be noted that this opinion concerns only the proposal to introduce into the existing type of provident scheme with limited benefits provision for general practitioner treatment [illegible]

When the report of the Committee [illegible] Repre sentative Body there was a strong feeling that the subject should be further considered and the Council was instructed to explore the possibility of elaborating a scheme whereby persons with incomes above the limit of the national health insurance scheme could insure against the cost of general practitioner treatment as well as specialist treatment given in institutions This matter is at present actively under discussion

---

From August 19 to 21 a congress for the development of medical post graduate institutions will be held in Berlin all German scientific medical societies participating The organizations in foreign countries interested in medical post graduate work will also be invited and it is hoped to found an international committee for the subject In connexion with the congress there will be an exhibition of modern methods of instruction—cine matograph films projection apparatus etc Matters of organization are in the hands of Dr Blome and the office is at Kaiserin Friedrich Haus Berlin NW 7, Robert Koch-Platz 7

dosage, might produce mental symptoms ranging from vague apprehensions to maniacal excitement The diagnosis of hyperplasia or neoplasm of the pancreatic islets might be unfortunately overlooked Hallucinations occasionally complicated hypoparathyroidism Pineal tumours resulted in mental precocity and sometimes insanity Turning to the gonads the speaker said that many mental defectives were prone to hypogonadism Among the vague endocrine manifestations in dementia praecox reversed secondary sexual characters and variations in gonadal structure were perhaps the most frequent Very few definitely hypogonadal individuals escaped a sense of inferiority which might develop into a positive psychosis On the endocrine side of the menopause it might be stated that there was temporary over secretion of prolan, apparently as an attempt to stimulate the failing ovarian secretion which led to a vasomotor instability and might well be a contributory factor in instability of the emotional and mental kind It was interesting that both at the menopause and after castration there was an increase in a certain type of cell in the anterior pituitary The evidence in favour of a male climacteric was rather unsatisfactory, but the effect of a hypertrophied prostate in removing normal sexual inhibitions was only too clearly demonstrated in the law courts

Functions of the Hypothalamus

Dr F A PICKWORTH said that in 1928 he read before the Society a paper showing the very frequent occurrence in cases of mental disorder of symptoms referable to the hypothalamic region of the brain He collected such signs and symptoms from sixty cases which later were published in the *British Medical Journal* Since then the hypothalamus had been shown to have very important functions in relation to endocrine activity and it was now customary to speak of the pituitary and hypothalamus as an endocrine nervous unit acting as a whole This however, was misleading since many if not all of the other endocrine glands acted through or were influenced by the hypothalamus Of the glands influencing the hypothalamic region the pituitary had the most intimate nervous and capillary connexions He proceeded to show by lantern slides a method by which pituitary hypothalamic dysfunction resulted from irritation by contiguous septic processes in the adjacent sphenoidal sinus A macroscopic abnormality of the pituitary could be detected post mortem in a large proportion of cases of mental disorder Dr Pickworth's conclusion after describing and illustrating some cases was that no direct relationship existed between endocrine activity and mental disorder, and that a connecting link was necessary for an intelligent understanding of their relationships This link was he believed to be found in disturbances of the capillary circulation of certain parts of the brain—for example, in the sympathetic parasympathetic regions of the hypothalamus where psychic stimuli met and acted conjointly with stimuli arising from various endocrine activities to govern visceral metabolism The fine capillary circulations of such areas were undoubtedly affected in two clinico pathological conditions—namely chronic syphilis (general paralysis) and chronic sepsis In chronic sphenoidal sepsis the contiguity of the toxic processes to the pituitary hypothalamus and frontal cortex was a factor of primary importance in the aetiology and varying types of mental disorder, including that of mental defect

Dr A P CAWADIAS said that the two openers of the discussion were specialists and the specialist looked at the patient from a particular point of vantage, bringing certain elements into prominence and leaving others in shadow yet the shadows were as important as the lights Dr Golla had cited the work of Mott But did that work mean that schizophrenia was of testicular origin? Certainly not He thought there was too great a tendency to speak in terms of diseases it was the patient after all whom they had to treat They had to act on the predominant factor which was a factor individual to each patient He thought that many mental conditions especially psychoneuroses had been described as of endocrine origin on insufficient data It was forgotten that endocrinology was really a development of metabolism There were certain cases in which mental disturbance was due to endocrine action but it must be remembered that all hormones acted on the nervous system they were the regulators of metabolism and the nerve cells were under the influence of all metabolic disturbances Mental disorders were not always endocrine but often due to mental factors and while he thought it necessary to render to Caesar—that is the endocrines—what was justly due the mental and psychological factors ought also to receive their proper tribute

Internal Secretions and the Central Nervous System

Dr T R C FRASER reported a case from Maudsley Hospital in which definite abnormalities were found and removed, with relief of symptoms It was a woman, aged about 30 who for eighteen months had been suffering from what was described as neurasthenia—tiredness, insomnia irritability and attacks of palpitation Towards the end of this period she began to have attacks in which consciousness was disturbed and the interesting feature of them was that they appeared to be typical catatonia Her hands and legs would stay in any position in which they were put In walking she would walk into a wall not noticing it was there It was discovered that there was an adenoma of the pancreas and its removal not only relieved the attacks but also the interval symptoms Several biochemical observations made while in hospital indicated that the symptoms from which she suffered could not be entirely explained in terms of blood sugar level One day she might be seen in an apparently normal state and another day in complete coma but the variation in the blood sugar figures was in the opposite direction The conclusion was eventually reached that the occurrence of these attacks was as closely related to the amount of insulin circulating in the blood as it was to the blood sugar level That might indicate the possible influence of one other internal secretion on what might be presumed to be central nervous system functioning

Dr PATERSON described some experiments by Richter in New York on the measurement of spontaneous activity in rats It was found that if certain glands or organs were removed there was no change in cyclical activity, but on the other hand if the anterior lobe of the pituitary were removed the animal became almost totally inactive Resection of the suprarenals had less effect though no less definite that of the gonads had still less effect and the thyroid least of all This work had almost certainly a bearing on manic depressive psychosis in man In time even clinically it might be possible to distinguish two types of cases one the patient who was simply using fatigue as a conversion symptom just as he might use some other disability and the other the patient who was really suffering from a definite temporary failure of spontaneous activity Individuals varied in the amount of activity displayed in the routine of living This activity depended on external and internal factors on the opportunity of the situation habit and ability to direct energy into social channels but also on some internal drive The investigation of this last named factor seemed interesting

Dr N HARRIS gave certain experiences of treatment of cases falling in the manic depressive group In women suffering from depression at about the menopause there were some who still menstruated regularly and others whose menstruation had ceased The oestrogenic substance would presumably be most effective in the latter but the results of treatment needed correlating Dr H A PALMER suggested an experimental control in a large hospital by using in one series of patients a barbiturate and in another paraldehyde The question of the hypothalamus needed to be put on a sound experimental level One interesting point was a biphasic effect in the recovery of many of these cases The patient was given the treatment got better gradually relapsed and afterwards began

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

Income Tax Allowances

It is not always clear to practitioners what are the allowances which they can claim for income tax purposes in respect of apparatus, plant, machinery, etc, used in their profession In the case of a practitioner setting up in practice for the first time his expenditure on his initial equipment is capital and not allowable as a professional expense Expenditure on additions is similarly not allowable The practitioner can, however, claim allowances for the wear-and-tear of his equipment, or, alternatively, he can claim as professional expenses the cost of renewing it as and when the expenditure is incurred It must be noted that he cannot claim allowances for wear-and-tear as well as for renewals The one basis is alternative to the other

Allowances either by way of wear-and-tear or by renewals are independent of the allowances which may be claimed for ordinary maintenance of the equipment If any part of a unit of equipment breaks or requires renewal the cost of repair or renewal of that part is an ordinary professional expense, and may normally be claimed as such, even though an allowance for wear-and-tear is being claimed in respect of the unit as a whole For example, a practitioner whose equipment is being dealt with on a wear-and-tear basis who buys an artificial sunlight lamp is not entitled to claim the cost of the lamp, but he is entitled to claim the cost of a new burner or of the repair or renewal of any part which may be broken or damaged The allowance for wear-and-tear, usually at 7½ per cent on the written-down value of the equipment, would not be affected by this claim

When the practitioner decides to purchase new apparatus, because the old has become obsolete or is otherwise useless, he can normally claim an obsolescence allowance As an example, a practitioner who has bought an artificial sunlight lamp for, say, £25, discards it in three years' time, and in its place purchases a new one, priced at £30 During those three years he will have received a depreciation allowance of 7½ per cent per annum, and the valuation has thus been written down by approximately £5 4s The value of the old lamp when it is discarded is therefore considered to be £19 16s, but he only receives £2 for it as an allowance from the makers in part exchange He may claim the difference, £17 16s, as obsolescence since the cost of the new lamp (£30) exceeds this amount This obsolescence allowance may be claimed irrespective of any amounts which may have been claimed and allowed previously in respect of the repairs and renewals of parts

Gratuitous Attendance on Professional Colleagues

There is no rule that medical practitioners should not charge one another for their services Gratuitous attendance on professional colleagues, although quite usual, is a matter of grace and does not rest upon any obligation of etiquette or ethics

---

Dr W Groom and Dr R Butterworth, two Wisbech doctors have just retired Dr Groom has practised in Wisbech for fifty-five years and Dr Butterworth for thirty years

INSURANCE MEDICAL SERVICE WEEK BY WEEK

SOME HOSPITAL PROBLEMS

We are giving a few notes this week on questions which arise from time to time concerning the insurance practitioner's responsibility when a patient needs hospital treatment or is an in-patient at a hospital

At the outset it is important to note that insurance practitioners have a collective responsibility for the medical treatment (within the range of service undertaken—that is, broadly, a general practitioner service) of every insured person who applies for it An insured person, wherever he may be in Great Britain, is entitled to medical treatment, but this is subject to an important qualification when he is in hospital An insurance practitioner is not responsible for the treatment of insured persons in hospitals or similar institutions which are not open to medical practitioners generally for the treatment of their patients The following statement, issued by the Insurance Acts Committee in March, 1931, has been printed in Appendix No 10 of the new edition of *Medical Insurance Practice* which is now on sale, and it is included here in order to make this note on hospital questions as complete as possible The statement has particular reference to the supply of drugs and appliances to insured persons in hospital, but it helps to make clear the general position

'If a hospital has a restricted medical staff no insured person is entitled to any treatment at the hospital *qua* insured person nor is any member of such staff who is also an insurance practitioner, entitled to treat at the hospital any patient *qua* insured person It follows, therefore, that the occasion never arises when such a hospital is called upon to dispense, nor any insurance practitioner upon the staff entitled to prescribe *qua* member of the staff of the hospital medicines or appliances at the cost of the national health insurance funds If a voluntary hospital with a restricted medical staff considers that it is spending a considerable amount of money on drugs and treatment to which the recipients thereof are entitled under the National Health Insurance Acts (*a*) it should refer to their insurance doctors all patients (whether in or out patients) for treatment which they are entitled to receive under the N H I medical benefit scheme, and (*b*) it must realize that if this course is not adopted it is not possible to contend that money spent on treatment given or drugs supplied to such persons at the hospital is money spent on treatment or drugs to which such persons are entitled under the N H I Acts

'In the case of a voluntary hospital with an unrestricted medical staff a different set of circumstances arises Any member of an unrestricted visiting medical staff of a voluntary hospital who is also an insurance practitioner is in the same position as regards the treatment (including the prescribing of medicines and appliances) of any insured person who applies to him at the hospital for a service included in his present contract with the insurance committee as if the patient had attended at his surgery provided that the hospital is within the district in which the practitioner has agreed with the local insurance committee to visit patients For such cases seen at the hospital the doctor would write out any necessary prescription on the usual national health insurance form, and the patient being entitled to free choice of chemist for the dispensing might choose the hospital dispensary if on the chemists list for the area, or he might choose to go to some other chemist in the area

'A voluntary hospital whose name is included in an insurance committee's list of those supplying drugs and appliances is in the same position as any other chemist on that list it will be compelled to dispense the prescriptions brought to it by any insured person issued by an insurance doctor it must conform to the arrangements as regards the hours and place of business etc, in operation in the area which apply to

to make a possibly permanent recovery He gave an interesting hypothetical explanation Dr Doris Odlum drew attention to the exacerbation of all kinds of symptoms in women during the menstrual period This was very noticeable in schizophrenic and manic depressive cases and all kinds of neuroses Possibly it was this which gave rise to the old idea of an association of lunacy with the full moon This exacerbation in all women of unstable emotional make-up at the time of the menstrual period was a point in favour of the connexion between endocrine alteration and psychological factors

Minor Degrees of Endocrine Instability

Dr Levy Simpson, in summing up the discussion, said that there was a certain agreement between Dr Golla and Sir Walter Langdon-Brown, except that the latter tended to carry the reciprocal influence of the endocrines and mental functions rather further The speaker did not think it possible to over emphasize this reciprocity, there were many instances of it Shock, for example, might cause a premature menopause, anxiety might cause amenorrhoea lasting for some months The effect of hyperadrenalism on emotion was well known, it had been said that all the emotions of a love scene could be produced with an injection of adrenaline Hyperthyroidism seemed to work both ways There was also some evidence of a vagus type of hyperinsulinism which might lead to disorder of conduct He drew attention to the very interesting condition of anorexia nervosa in which could be seen—and one assumed it had nothing to do with endocrines to start with—all the changes that occurred in Simmonds's cachexia—namely, low blood pressure, low blood sugar, increased carbohydrate tolerance, amenorrhoea, hyperplasia of uterus, low temperature, low basal metabolic rate, low serum protein How did it occur? There were two mechanisms, one nervous, the other having to do with vitamin deficiency If animals were kept on a vitamin-deficient diet changes were found in the adrenals and the pituitary—first congestion, perhaps hyperplasia, ultimately degeneration and atrophy If that occurred it would explain to some extent the changes which Cushing found in the pituitary in schizophrenia, and possibly those found by Mott Those who were not very enthusiastic about the endocrines were perfectly entitled to point out that when endocrine stigmata occurred in the psychotic they were by no means of primary importance But taking the broad view of Dr Golla, and speaking not so much of mental disorder as of disorder of conduct and emotional instability, anyone who saw a large number of cases of endocrine disorders must come to the conclusion that such disorders did affect emotional and mental behaviour and the fundamental characteristics of the patient He agreed that the changes would vary according to whether there was an underlying constitutional neuropathic tendency, but one was bound to come to the conclusion that there was a definite association, to be found not only in gross cases but in lesser ones not regarded as pathological at all

It was possible, Dr Simpson continued that endocrine disorder occurred in nearly everybody Perfect constitutional balance of the endocrines was found in few He got a little worried sometimes on going to a dinner party and realizing that 70 per cent of the guests were suffering from endocrine disorders The changes were constitutional, familial, sometimes racial He took as an example two instances of endocrine imbalance, not uncommon, and passing unregarded One was the woman of post-menopausal age whose pituitary and adrenal cortex had undergone hypertrophy She became virile, not in the sense of gross hair changes and so forth, but of a different outlook on life acquiring aggressiveness originality, fearlessness, becoming the brilliantly capable business woman, the suffragette or her modern equivalent, or, if she retained sufficient of her feminine characteristics, the powerful matriarch of G B Stern and other novelists The other example was the pituitary type of adiposity manifesting itself at adolescence, the young woman, fat in face, neck, and body, good-looking, with a pleasant smile, very popular, nearly always musical, often with a rich mezzo contralto voice, loving dancing, very light on the feet, engaging in many social activities, very happy and alternatively very sad, recalling in a lesser degree a manic depressive psychosis These two types illustrated the influence of the endocrine glands on the emotional and mental make-up and behaviour of people who would not be regarded as abnormal

THE LUMBO-SACRAL VERTEBRAE AND SCIATICA

The annual meeting of the Devon and Exeter Medico Chirurgical Society was held on January 28, Mr A I Candler occupying the chair in the absence of the newly elected president, Dr R H Norman

Mr Norman Capener reported anatomical and radiological investigations of the movements of the lumbosacral spine, with special reference to the mechanical factors underlying sciatica

He said that with a more detailed study of the mechanics of the region it would probably be found that there were fewer cases to be labelled "idiopathic sciatica" Even the term "sciatic neuritis," in the sense of an infective phenomenon, was less often justified than was usually thought Mechanical factors must be of greater importance, otherwise one would expect to find the femoral nerve, for example, as often the subject of neuritis He described the variations in shape of the spinal canal, the intervertebral disks, and foramina in different movements of the lumbar spine as seen in the radiographs of the intervertebral disks, and foramina in different movement possible in the lumbar spine, contrary to the teaching of most anatomists The intervertebral disk was seen to be markedly affected by such rotatory movements as well as by the usual lateral and antero posterior movements The possibility of posterior prolapse of the nucleus pulposus or of the annulus fibrosis was discussed and, after acknowledging the work of Love and Camp at the Mayo Clinic, the following case was shown

A railway engine driver, aged 41, "sprained" his back at his work in April, 1935, and a short time later began to suffer severe pain in the right buttock and thigh The pain was accentuated after exertion, but was relieved by lying down When first seen in September, 1935, he had typical right-sided sciatica with homolateral scoliosis, rigid lumbar spine, gluteal wasting, and a diminished Achilles reflex There were no sensory changes No obvious cause could be found for the sciatica, and the x-ray findings were negative During the next six months he received the usual conservative treatment, including radiant heat massage, plaster jacket, sciatic nerve stretching, epidural injections, and manipulation under anaesthetic—all without lasting improvement In the summer of 1936 he had pneumonia, and the sciatica became very much worse The pain now involved the opposite side, and he was altogether in a very unhappy condition On October 30, 1936, lumbar puncture at the level of the third and fourth lumbar vertebrae with manometry was performed, the pressure was normal, and there was the usual rise on jugular compression A needle was now passed into the sacral hiatus as for an epidural injection and novocain saline solution was injected into the epidural space There was a small rise in the intrathecal pressure, but not corresponding to the amount of fluid injected, thus suggesting a partial spinal block The cerebro spinal fluid contained 60 mg per cent of protein Two days later 5 c.cm of lipiodol was injected into the theca at the first lumbar interspace and radiographs were taken in different positions, recumbent and erect The evidence obtained by this means strongly suggested a constriction of the theca arising from the front of the canal in the region of the disk between the fourth and fifth lumbar vertebrae Following the lipiodol examination the patient had very severe pain which had to be relieved by further lumbar puncture On November 12 laminectomy was performed upon the fourth and fifth lumbar and first sacral

long before the emotional psychology of childhood had been investigated One thing is certain the teacher who is to practise the method must be herself possessed of an exceptionally balanced nature we may be forgiven indeed for wondering how much of Dr Montessori's undoubted success is due to her method and how much to her own exceptional personality

Other sections of the book contain plenty of interesting and stimulating ideas the suggestion that young babies should not be clad for example and some others which may jar on the medical ear as may the almost devotional note which the author tends to strike These are but small things the child is Dr Montessori's god and she is no minor prophet If then in her writings the dispassionate attitude of the scientist gives way at times to the passionate zeal of the apostle how shall we blame her?

PSYCHO-ANALYSIS

Inhibitions Symptoms and Anxiety By Sigmund Freud M D LL D Authorized translation by Alix Strachey (Pp 179 6s net) London Hogarth Press and Institute of Psycho Analysis 1936

Mr Alix Strachey has recently translated from the German a monograph written by Professor Sigmund Freud entitled *Inhibitions Symptoms and Anxiety* This work was first published in Vienna in 1926 by the Internationaler Psychoanalytischer Verlag An American translation supervised by L Pierce Clark appeared in 1927 but this was never issued in England and is now out of print The serial publication of another American translation by Henry Alden Bunker was begun in the *Psychoanalytic Quarterly* in October 1935 by which date however the present translation was virtually complete

This monograph is an interesting and valuable addition to the International Psycho Analytical Library edited by Dr Ernest Jones Coming as it does from the founder of the psycho analytical movement the book will be especially prized by those who are conversant with the theory and practice originated many years ago It is an important contribution to psychopathology

CLINICAL DERMATOLOGY

Introduction to Dermatology By E H Molesworth M D Ch M (Pp 520 151 figures 25s) London J and A Churchill 1937

Australian textbooks on dermatology are certainly not numerous and the *Introduction* by Dr E H Molesworth of Sydney is welcome as an exposition of this branch of medicine in which emphasis is naturally placed on the types of skin disease which are most characteristic of the Antipodes As the author points out the most striking difference between the dermatology of Europe and of Australia lies in the respective frequency of tuberculosis and cancer He states that since 1910 he has only seen one case of lupus vulgaris originate in Australia On the other hand to quote his own words 'carcinoma of the skin provides the daily task and common round of the dermatologists of Australia Fortunately owing to the keenness of the general practitioner to recognize it in its earliest stages and the skill of the specialists in treatment the number of deaths occasioned by it remains insignificant in comparison with those from malignant disease of any other organ but its importance is reflected in the volume before us by the space given to the discussion of the disease and its treatment by radiation

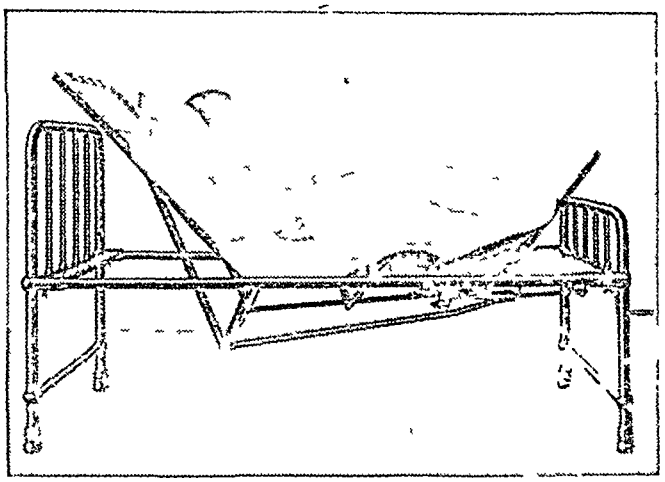
Another disease leprosy which in Western Europe is scarcely more than a curiosity is still a serious problem among the aboriginals of Australasia and the Pacific Islands Consequently Dr Molesworth has devoted a space to it proportionate to its gravity The only aspect of leprosy which is not fully dealt with here is the treatment for the very good *reason that this volume* is intended for private practitioners who are seldom called upon to treat it for the vast majority of cases, at all events in more or less civilized communities are segregated in institutions and colonies While naturally special attention has been given by Dr Molesworth to those parts of the subject upon which his own experience is centred we hasten to add that he has nevertheless presented a well balanced picture of clinical dermatology, which we are sure will become a standard textbook in the medical schools of Australasia *Dermatologists of* other regions will also find it both interesting and instructive for it contains a good many original observations by an author whose views are always sound and well balanced

No notice of a dermatological work is complete without some reference to the illustrations These consist entirely of photographs and photomicrographs of good quality For coloured illustrations Dr Molesworth prefers to refer readers to one of the atlases by MacCormac and Semon *As he rightly says this is far better than the insertion* of a mere dozen coloured plates in his own textbook while the inclusion of an adequate number would raise the price to a prohibitive level

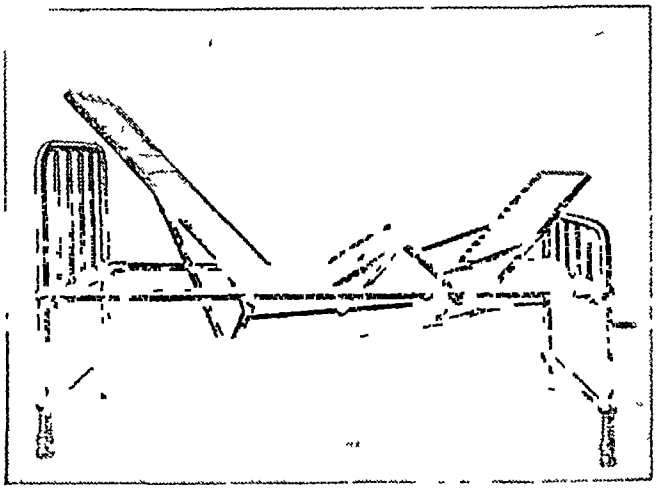
Notes on Books

Food and the Principles of Dietetics by Dr ROBERT HUTCHISON and Professor V H MOTTRAM has the distinction of being one of the most readable textbooks on this subject in the English language which moreover incorporates a remarkable amount of varied information We therefore welcome the issue of the eighth edition (E Arnold and Co 21s) Its appearance only two years after the seventh is an indication of the well deserved popularity of the work Dr Hutchison did a good service to the profession when he decided to publish his lectures in book form at the beginning of the century The text has been generally revised and in particular a good deal of new information has been incorporated in the early chapters regarding the important problem of the calorie requirements of populations The form and arrangement of the volume have not been altered and it is so well known that any detailed description is unnecessary

We have received volume xxvi (1936) of the *Transactions of the Pathological Society of Japan* an imposing volume printed largely though not altogether in German and English and containing abstracts many of which are excellently illustrated of 173 papers read before the society These cover a wide and representative range of subjects and indicate that the major problems of infection and of neoplasia and a variety of other studies which are engaging attention nearer home are being vigorously pursued by many workers in Japan Apart from a few parasitic infestations the only disease *unfamiliar to us* which forms the subject of a group of papers is the epidemic encephalitis which has recently occurred in Japan We have only to mention such names as Shiga Yamagiwa and Kitasato to recall that Japan has made contributions of the first rank to pathological knowledge and the present activity in Japanese laboratories bids fair to maintain their traditions



Lymphatologie (Heft 5) gives an account of about fifty researches in lymph carried out at the Anatomical Institute of the Imperial University at Kyoto The present section deals with the physiology of the lymph glands and biochemical and immunological problems connected with this system The various researches therefore cover a wide variety of problems and Professor Funaoka the head of the department is to be congratulated on the manifold activity he has inspired



Preparations and Appliances

BEDSTEAD OF NEW DESIGN

Dr MELBOURNE THOMAS (medical superintendent, Llwynypia Hospital, Rhondda) writes The bed frame about to be described was built after long residential experience in hospital had taught me something of the value, in convalescence, of muscular relaxation and postural comfort I do not think the importance of these factors in convalescence is commonly or sufficiently appreciated They are worthy of elaboration, but this is outside the scope of this communication Furthermore, I believe that patients often leave a bed at home to enter a less comfortable one in hospital

These observations stimulated me to design the bed-frame illustrated, wherein the shortcomings of the 'Fowler bed-

stead" as commonly designed have been minimized in the following ways (1) causing the buttocks to rest in a ⌒ shaped interval in place of the customary ⌄ shaped interval, (2) supporting the proximal two thirds of the thighs in place of the knee-joints, (3) providing a foot-rest, and that at a variable inclination No 1 results in greater comfort to the lumbar region—a point of considerable importance—and prevents the usual tendency in a 'Fowler bed' in a weak patient to gravitate towards the foot-end No 3 gives the patient a feeling of postural security, prevents the tendency to plantar flexion at the ankle joint, and relieves the toes of the weight of bedclothes

The bed is further designed to accommodate comfortably either a tall or a short patient The designs have been implemented by the makers with a simple and neat mechanism which appears durable and is easily worked by a nurse I recommend the bedstead to be used in conjunction with a sponge rubber mattress Experience of the use of this bedstead with a variety of patients in the sick wards has confirmed what was expected of it It gives I believe, to the patient a degree of comfort hitherto unavailable

The bedstead is manufactured by Albert Phillips Ltd, Excelsior Works, Birmingham, and may be obtained from the Surgical Manufacturing Co Ltd, 83-85, Mortimer Street, London, W 1

BLOOD-TRANSFUSION CANNULA

Dr J H DIXON (Royal Free Hospital) writes

The method described below of drawing blood from donors for transfusion is simple to perform and certain in obtaining the quantity of blood required The instrument used consists of a trocar and cannula not unlike that used for the induction of artificial pneumothorax, only it is smaller and its stuff box at the handle end contains no washer The size of the cannula is practically the same as that supplied with Jube's transfusion syringe The apparatus might well be described as a mixture of the good points of a Jube's cannula and an artificial pneumothorax induction cannula without their disadvantages

A vein in the ante-cubital space is located and the skin is anæsthetized by injecting subcuticularly a few minims of 2 per cent novocain The point of the needle touches the skin over the vein This skin is then pulled laterally before the injection is made, thus ensuring that the vein is not punctured In the same position a small nick is made in the bleb of novocain with a tenotome (this greatly facilitates the passage of the

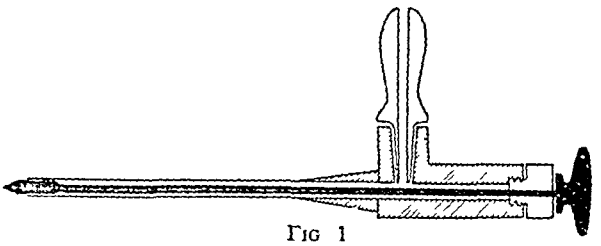


FIG 1

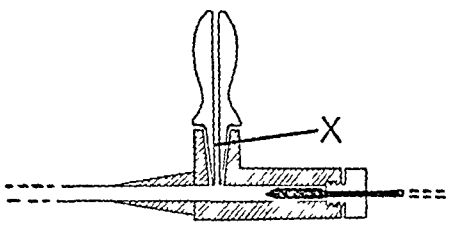

FIG 2

trocar and cannula through the skin) Both trocar and cannula must be held while venipuncture is made, when in position the trocar will be as in Fig 1 The trocar is now withdrawn to the position shown in Fig 2 Blood will then flow down the cannula and out at the opening X, into which is fitted a nipple to which a length of rubber tubing is attached The following are points worth mentioning (1) Patients have expressed surprise that no pain was caused to them after the first prick to admit novocain (2) When the cannula is in and the trocar is withdrawn no damage can be done to the inside of the vein because the end of the cannula is quite blunt (3) The cannula can be cleared without disconnecting the rubber tubing or spilling any blood by pushing back the trocar This procedure is carried out at three to four-minute intervals to ensure that blood does not stick to the sides of the cannula It is better to do this early, because if left till the blood stops flowing solid blood clot might be dislodged and cause trouble later (4) Using the above technique it appears that the vein will deliver any amount of blood, whereas with the older methods the needle tends to become blocked after about 400 c cm, with the above method however, 800 and 1,000 c cm may be withdrawn (not quickly though) with ease (5) No blood need be seen by the donor at any time during the operation (6) It is an advantage to have two nipples with tubing so that a change may be made should the tubing become blocked The trocar and cannula can be had in any size required, and is made by the Medical Supply Association of Gray's Inn Road W C

vertebrae The constriction at the level mentioned was amply confirmed there was no pulsation below this level and the posterior projection of the disk was verified In addition the constriction of the dura appeared to be circumferential in nature This was widely opened up in the midline the disk was not interfered with and the wound was closed Immediate and complete relief was experienced after recovery from the operation The man was present at the meeting All objective evidence of sciatica had disappeared He reported that since leaving hospital he had been back at his usual work which occasionally involved coaling the furnace There had been no suspicion of any return of pain and he was very enthusiastic about the benefit from the operation

Mr Capener illustrated this case with radiological films taken at all stages He also showed on the screen x ray photographs of the lumbo sacral spine in support of his contention as to the rotatory movements

Mr A A GAIRDNER asked if it would be possible to avoid opening the dura and to remove the obstruction without so doing Mr CAPENER agreed in the main with Mr Gairdner s views but said that in this particular case it was essential to open the dura in order to let out the lipiodol, and there was the further complication of the constriction He did not wish to suggest that the elaborate investigations and treatment were likely to be necessary in very many cases of sciatica but he stressed the point that in intractable cases particularly where there was a history of violence in the flexed position of the spine, such a course should seriously be considered

HEPATITIS AND CHOLECYSTITIS

At a meeting of the Liverpool Medical Institution held on February 4, with the president Professor R E KELLY in the chair, Professor J W MCNEE read a paper on the medical treatment of hepatitis and cholecystitis

Professor McNee dealt first with the definition of hepatitis describing it as the response of the liver to injury He argued that, apart from conditions such as abnormalities and tumours most of the conditions of hepatic disease described in textbooks under separate names could be united as examples of hepatitis The pathological process varied from cloudy swelling in fevers through fatty infiltration or degeneration to the most severe hepatitis of all—necrosis of the liver cells or of large areas of liver tissue so called acute necrosis or yellow atrophy of the liver Even the condition commonly known as cirrhosis of the liver was readily included as "chronic interstitial hepatitis, analogous with chronic interstitial nephritis Various factors influenced the effects of hepatitis whether this was acute or chronic temporary or severe The two most important were first the great excess of liver tissue over normal needs which nature had provided and secondly, the amazing power of regeneration of liver cells which could resume full functional activity The essential point in the treatment of all forms of hepatitis was to allow the damaged liver the best chance to regenerate, and glucose was the only support that could be given

Cholecystitis

Turning to cholecystitis Professor McNee remarked on its commonness and on its infrequent diagnosis in its earliest stages when medical treatment was of avail The possibility of catarrhal cholecystitis must be considered in every case of indigestion not due to obvious organic disease of the stomach such as ulcer and not responding to simple treatment The suspicion of cholecystitis was increased if flatulence was a notable symptom The varieties of cholecystitis were discussed and a division made between those of more interest to the surgeon and those essentially of medical importance In discussing the aetiology of cholecystitis three factors were considered the metabolic, especially as affecting cholesterol metabolism, the infective and the problem of bile stasis

A serious difficulty in interpreting the problem of infection was pointed out was the infection deep in the gall bladder wall only, as surgeons suggested or was it in the fluid contents of the gall bladder? If the former no biliary antiseptics excreted in the bile would be likely to have great therapeutic effect, but only some remedy acting through the blood stream It was of the utmost importance for the patients that this problem should be satisfactorily solved Methods of certainty in the diagnosis of catarrhal cholecystitis were discussed great emphasis being laid on the use of the duodenal tube to obtain samples of bile for microscopical examination

Finally the medical treatment of cholecystitis by diet medical drainage olive oil magnesium sulphate and at times by the duodenal tube was discussed and reference made to prognosis after medical treatment Once gallstones had formed no curative medical treatment was possible but even in such cases much medical treatment might be required before and after operation

Cholecystography

In the discussion which followed Dr N B CAPON referred to some of the forms of hepatitis seen in childhood and agreed that glucose was useful in these cases especially when combined with insulin Dr R E ROBERTS said that while in certain cases the information obtained from cholecystography was unreliable in the majority of cases it was more exact than that available from any other source In a normally functioning gall-bladder or in a frankly non filling gall bladder the presumptive evidence in favour of normality or disease of the gall bladder was very strong In the case of opaque gall stones direct radiography might suffice but in the case of non opaque gall stones cholecystography might give incontrovertible evidence There was however a type of gall bladder in which the results of oral cholecystography were doubtful—namely the type which filled well emptied normally but throughout the examination showed a shadow of subnormal density It was not at all clear whether the radiologist was justified in regarding such appearances as showing subnormal concentration and being an indication of cholecystitis or whether they were merely evidence that something was amiss with the absorption of the dye from the bowel and with its subsequent excretion by the liver So many factors had to be considered in the transit of the dye from the mouth to the gall bladder that many possibilities in the nature of faulty absorption or elimination might have to be excluded before the diagnosis of cholecystitis was justifiable Such exclusion seemed at present to be impossible without subsequent resort to intravenous cholecystography

Diagnosis

Professor HENRY COHEN, while acknowledging the value of duodenal intubation as a diagnostic measure stressed the importance of correlating the evidence it afforded with that derived from clinical and radiological investigation Cholecystitis might be the sole manifestation of such lesions as gall stones or neoplasms in the biliary tract and its adequate treatment depended on a recognition of the underlying causative factors Of the value of cholecystography there was no doubt it was in that Institution that he showed with Dr R E Roberts the first series of cholecystographs taken in England but as a clinician he was alive to its dangers Pain in the right upper quadrant of the abdomen in the days before cholecystography was an exercise in careful anamnesis Now too often the mere hint of discomfort in this area associated with slight flatulence led to a radiological examination of the gall bladder and if gall stones were revealed cholecystectomy followed But gall stones were not uncommonly symptomless and their association with certain symptoms might be accidental and not causal

in the presence of pus always with the precaution of an antiseptic oil afterwards and usually before, and always doing the minimum for I have a great respect for the inferior turbinate because of its function and of the way it behaves when maltreated I never use a snare to it except for moniforms Rarely I have excised a small piece and brought the flaps together or even done a *small submucous resection if the bone were the offender*

Sir Robert alludes to the interesting question of the function of the turbinates a question which the physiologists have never properly faced I have discussed this elsewhere so will here just repeat the question Why, if the function of the turbinates, especially the inferior, is that of warming, moistening and cleansing the entering air, are they most in evidence when least needed (as when one is sitting in a warm room, when they almost block the airway the inspiratory current then taking mostly the olfactory path along the septum to the upper reaches of the nose) and least in evidence when most needed (as during violent exertion when they are drawn tight to the bone, the air passing over the ostia of the sinus and around the spongy ethmoid, and so gaining accessory warmth)? Certainly the turbinates have directional function—I am, etc,

Koch's Work on Tuberculin

SIR—In your issue of January 23 (p 162) Dr Robert Aitken refers with surprise to the statement that no entirely satisfactory or adequate examination of Koch's work on this subject has hitherto appeared, certainly not in this country[1] It is well that this statement should be challenged as it has been made before, and, if true, constitutes a grave indictment of medical research

It will be useful to define the words Koch's work on tuberculin By those words must be understood Koch's completed work It is not sufficiently realized that the old tuberculin of 1890 and the ideas underlying its use represent only the first steps in an evolution which by 1897 led to a totally different conception of specific treatment In 1890 the violent focal destructive effect was the obvious phenomenon—not destruction of the living tubercle bacilli but destruction of tuberculous tissue It was only after six more years of work under the searching influence of world-wide criticism, misconception, and denunciation that Koch quietly published in 1897 a small article on New Tuberculin Preparations," embodying the results of his completed work and claiming for the new tuberculin 'a quite decided immunizing action' It is on TR and the closely related BE, used with a full knowledge of immunization as understood by Koch, that we must concentrate for an adequate trial of Koch's specific method of treatment

In his article of 1897 Koch states that he seeks with TR to avoid reactions as much as possible and by gradually increasing the dose—certainly as quickly as possible but also with the utmost restraint—to immunize against TR and with it he believed, against the tubercle bacilli themselves Application and dosage he describes as very simple The fluid contains in 1 ccm 10 mg solid substance One begins with 1/500 mg or less with which only *exceptionally a reaction* occurs The injections are given about every second day with such a gradual increase of dose that rises of temperature of more than half a degree are as much as possible avoided Any rise should have completely settled before the next injection *As a rule he raises the dose to 20 mg and then if no reaction follows desists or only injects after long pauses In immunizing the sound and treating the sick everything depends on attaining as large a dose as possible* absorption *may* be gauged by the behaviour of the injection site In the beginning such small doses are given that no immunization worth speaking of can be expected first when one rises to larger doses 1/2 to 1 mg do unmistakable workings of immunity appear In cases of lupus it is especially remarkable that the local reactions remain very small notwithstanding which a steady continuous improvement takes place He ventures not to assert that TR is the best preparation perhaps the whole substance of the bacillus would be better (BE) or combination with a serum Under the guidance of agglutination Koch subsequently gave preference to the whole substance (BE) and at one time under the same guidance he was of the opinion that not too small reactions favoured a rise in the agglutination values but the general principles remain the same and with BE the dose to which he rose was 20 mg or in certain cases even more

It is in the light of the publications of 1897 and 1901, small portions of which are here briefly epitomized, that investigations of Koch's work on tuberculin must be scrutinized It is astonishing how few investigators seem to have studied the originals Clinicians still constantly confuse the ideas and preparations of 1890 with those of 1897 and 1901, which are of a totally different order, and no satisfactory examination of Koch's work is possible except under the most scrupulous adherence to his ultimate directions

Now Sir, where in the annals of British Dermatology is there the record of a single case in which a dose of 20 mg of TR or of BE has been administered?—I am, etc

A Clot in the Cannula

SIR—In the *Journal* of January 23 in the description of his intravenous trocar and cannula Mr Reginald A King writes If clotting should occur in the cannula the obstruction can be overcome by one stroke of the trocar In such circumstances does Mr King clear the cannula while it is in the donor's vein? As one who has frequently to withdraw blood from the excellent donors of the British Red Cross Blood Transfusion Service I have never dared to remove a clot from a needle by such a method for fear of causing embolism Is my fear groundless?—I am, etc

Temporary Treatment in Mental Hospital Practice

SIR—Dr W J Barbour's article on temporary treatment in mental hospital practice (*Journal* February 6 p 281) will be enlightening to many who like myself have been engaged in applying, or attempting to apply Section 5 of the Mental Treatment Act during the past six years for the benefit of their patients In a letter which appeared in your columns in November 1930 about a month before the Act came into force I pointed out the ambiguity of Section 5 and asked for an official interpretation Although no official pronouncement was ever made on the subject it became clear that the Board of Control's view was—and remains—that as Dr Barbour himself points out the section applies only to a strictly limited number of cases This number I suggested in a later letter in all probability amounted only to about 5 per cent of the admissions to mental hospitals an estimate which was accepted by the late Professor George M Robertson Dr Percy Smith and others

How comes it then that at the Derby Borough Mental Hospital in 1936 the incredible proportion of 51 per cent

He had seen the gall-bladder and its contained stones removed for pain, later proved to be due to spinal tumour, caries, carcinoma of the lung, myocardial ischaemia, right pyelectasis, and other morbid conditions in which a careful recognition of the true significance of the patient's symptoms should have pointed to the cause of the pain

He considered Professor McNee's analogy between liver and kidney infections most helpful, and proposed that it should be carried a step further Might it not be that some cases of cholangitis and cholecystitis occurred independently of hepatitis, although the liver had excreted the infecting organism, while in other cases the liver itself suffered also from the infection, and might not the infection persist in the gall-bladder after the organism had ceased to be excreted by the liver? If so it was to be expected that some cases of gall-stones with associated cholecystitis would show hepatitis whilst others would not

The medical treatment of established cholecystitis, apart from the mild catarrhal types which might resolve without any treatment, was still, on the whole, disappointing Appropriate foods caused biliary drainage as efficiently as concentrated solutions of magnesium sulphate when judged by cholecystography Massive doses of hexamine often produced gastric and urinary discomforts whatever dose of alkalis was given with them Professor Cohen doubted if removal of the gall-bladder as a suspected source of focal sepsis was ever justified unless the gall-bladder itself was giving rise to sufficiently severe symptoms, which even in the absence of general toxic disturbances would justify its removal There was a danger in some centres of the gall-bladder becoming Bernard Shaw's "nuciform sac"

CYSTIC DEGENERATION OF THE ENDOMETRIUM

At a meeting of the North of England Obstetrical and Gynaecological Society held in Manchester on January 22, Professor D DOUGAL read a note on cystic changes in the endometrium associated with pseudo-mucinous ovarian tumour He said that in the last few years he had met three such cases the respective ages of the patients being 58, 60, and 61 The first patient was single, but the others were married and had borne children Each had a large abdominal cystic tumour and complained of a blood-stained vaginal discharge In each case a panhysterectomy with removal of the appendages was performed, and in each the tumour was a pseudo-mucinous cystadenoma In one instance an inoperable carcinoma of the descending colon was also present On opening each uterus after operation a quantity of blood stained pseudo-mucinous material was found on the endometrium, it was raised up to form a number of thin-walled cysts In two cases this was also found in the cervix Professor Dougal said that although it was possible that some of the pseudo mucinous material had gravitated through the tubes and formed implants there, this was not supported by microscopical examination He demonstrated slides showing extreme activity of the endometrium, the cysts appeared to arise from distension of the uterine glands, and not from proliferation of tumour cells He thought that the endometrial changes were due to attempts on its part to absorb pseudo-mucinous material which had gained entrance to the uterus If this theory was correct the uterine condition was really a pseudo-myxoma and comparable with the lesion found in the appendix in some cases of pseudo myxoma of the ovary

The PRESIDENT said that he had frequently seen a blood stained discharge in these cases Mr W R ADDIS (Manchester) thought it possible that the primary growth might be in the endometrium Mr ST G WILSON (Liverpool) suggested that the ovary might be producing oestrin, and that this in turn caused an active endometrium Mr MALPAS considered it possible that the ovarian cyst was malignant, and the growth in the colon not independent

Professor DOUGAL in reply, said he did not think the endometrium was primary, neither did he believe that there was any oestrin production In his opinion the carcinoma of the colon was quite independent.

Hormone Therapy in Gynaecology

Dr J W A HUNTER (Manchester) read a note on the results of six months' working of his hormone clinic at St Mary's Hospital, Manchester He expressed his indebtedness to his colleagues at the hospital for permission to record the results, it was premature to draw any conclusions but he hoped the results might be helpful to those who were considering setting up a similar clinic

During the first six months some ninety patients came to the clinic, most of whom were referred from the out patient departments Some of these were deemed unsuitable for treatment Others had only commenced treatment in the latter weeks, and had therefore not attended long enough, but there remained fifty two patients who had received sufficient treatment to justify a criticism of the results The cases treated were secondary amenorrhoea, 20, sterility or dysmenorrhoea, 6, hypomenorrhoea, 11, menorrhagia of puberty, 4, pruritus vulvae 5, repeated miscarriage, 3, menorrhagia 2, and primary amenorrhoea, 1 Of the twenty cases of secondary amenorrhoea fourteen had been temporarily cured—the periods had returned after treatment by varying amounts of intramuscular oestrin—but in only two had the restoration of function been permanent In four cases treatment in large doses had failed to restore the menstrual flow, a result at variance with those recorded by Kaufmann In five cases of pruritus vulvae associated with the menopause four had been definitely cured by oestrin therapy In four cases of adolescent menorrhagia three had been cured by treatment with intramuscular progestin injections In seventeen cases of scanty menstruation associated with dysmenorrhoea or sterility eleven had shown no improvement with prolonged treatment, and in six there had been some slight increase in the flow In no instance had the dysmenorrhoea been affected and no patient suffering from sterility had become pregnant Three cases of repeated miscarriage had gone to term with progestin treatment associated with the administration of vitamin E One patient with primary amenorrhoea had been treated with large doses of oestrin without effect, but two cases of menorrhagia in patients 30 years old had much improved under progestin treatment Dr Hunter said the preparations he had used were supplied by Messrs Schering In the cases of amenorrhoea he had used progynon B oleosum forte, he had found that the small single dosage necessary in any case to produce a menstrual flow was 300,000 units, the largest amount required in any one case was 1,250,000 units In the case of menorrhagia of puberty the average monthly dose found necessary to control the menstrual flow was 10 international units Dr Hunter added that most of the treatment employed had been replacement therapy, and that little had been done in the direction of activating therapeutically the pituitary hormones As regards permanent cures the results had been disappointing, with the exception of menopausal pruritus, other climacteric symptoms and adolescent menorrhagia The chief criticism of such a clinic was that one tended to be working in the dark with no certain knowledge of the underlying condition Cases might be essentially ovarian or primarily due to pituitary deficiency, but apart from clinical signs there was no method of establishing a diagnosis He thought that some help might be obtained by routine estimations of the basal metabolic rate, and also perhaps by estimation of the blood hormone content but for this a chemical laboratory and a skilled staff would be necessary It seemed to him that future progress was only possible along these lines

of their admissions were temporary patients? Are we to assume that they are breaking the law in Derby or is the explanation that, as I have heard seriously suggested, more confusional cases occur in Derby than elsewhere in the country? Even accepting Dr Barbour's own statement that it is "cases following childbirth, the various types of stupor, and cases where confusion is marked" which have the right to receive treatment on a temporary basis, I doubt if he will contend that these cases, as ordinarily diagnosed, amount to 51 per cent of admissions

The fact is that Section 5 of the Mental Treatment Act is differently interpreted in different parts of the country It seems to be the case that the visiting committees of the county and borough mental hospitals can interpret and apply the section as they think best The Board of Control may disagree, but as they visit these hospitals generally only once in a year they are not in a position to exercise any effective control in the matter In those hospitals, on the other hand, in the metropolitan area, more frequently visited by the Board, their more restricted interpretation is imposed—I am, etc,

FREDERICK DILLON

London, W 1, Feb 12

SIR—In the interests of those who may be asked to make statutory recommendations for temporary treatment, may I be permitted to offer the following comments on Dr W J Barbour's refreshingly enthusiastic description of what appears to be a legally indefensible use of Section 5 of the Mental Treatment Act, however worthy the motive Only where a truly medical mind is associated with characteristically Caledonian contempt for apparently valueless intricacies in the law is it possible to conceive that one-half of the direct admissions to an ordinary mental hospital could be complacently received as temporary patients

It will, no doubt, be recalled that when the Act (as a Bill) was in its committee stages an undertaking was given that volition meant, in effect, the unqualified expression of a wish to go (or not to go) to hospital It did not mean rational volition and no matter how insane the patient's reasons for his wish or how disjointedly or oddly it might be expressed it was made clear that if he expressed his wishes on this point at all he should not be deprived of his liberty and civil rights against his will, except on judicial authority By these criteria the presence or absence of volition is not a matter of opinion it is a matter of fact This is borne out by the wording of the statutory form of recommendation in which the practitioner declares—he does not state the opinion—that volition is absent So there is not now much room for controversy

Inasmuch as Section 5 makes inability to express volition an essential condition of reception as a temporary patient it would add considerably to the interest of Dr Barbour's series of cases in fact it would raise it to the status of a phenomenon- if he could assure us (*a*) that every one of his temporary patients had been asked effectively on the day of admission the question Do you wish to enter the mental hospital for treatment? and (*b*) that not one of them had expressed a wish one way or the other The thought that every other patient received into his hospital is either mute or unintelligible is an astonishing one I am not by any means opposed to temporary treatment but I should be very sorry to see a wise legal measure brought into contempt—a thing which would inevitably happen if every mental hospital in the country received half its patients on a temporary basis

So far as the general practitioner is concerned it is his duty to utilize those legal procedures which are best suited to the individual needs of his patients For example it is not at all certain that a practitioner could successfully defend the signing of a certificate (for Reception Order) in a case where it could be shown that volition was absent at the material time, and that the patient could have been properly recommended" for temporary treatment, any more than he could successfully defend the making of a statutory recommendation in the case of a patient who was capable of expressing his wishes, no matter how grossly insane the patient might be It is all very simple really, but even if it be admitted that there are complexities it is, after all, the practitioner's duty to know what he ought to do

There is a very simple formula which meets almost every case seen in practice If the practitioner is satisfied that the case is one for a mental hospital he should always put (in whatever form may be most appropriate) the question "Will you enter the mental hospital for treatment?" The answer gives the key to the proper legal procedure for admission ("Yes" = Voluntary, "No" = Certified, mutism, unintelligibility, or gross irrelevance = Temporary) The fact of question and answer, especially if entered in the records of the case, protects the practitioner and the patient This simple measure, even when carried out in one of the most conservative English counties, covering a scattered area where opportunities for disseminating knowledge of new enactments are limited, has already resulted in practically one-half of the direct admissions to the mental hospital being received without certificate—but not without volition—I am, etc,

Bucks County Mental Hospital, Feb 8 IAN SKOTTOWE

Abortion and the Law

SIR,—In a recent case before the courts, which resulted in a woman doctor being struck off from the *Medical Register*, we notice the defence stated that the practitioner in question had only completed the operation in cases where a partial abortion had already been procured This defence was not commented upon, and no doubt the courts and the General Medical Council had ample evidence of other causes of offence However, we should be very grateful for information as to the legal position of any medical practitioner in the actual circumstances as cited on behalf of this defendant That is, a patient who has already attempted to procure an abortion, comes for treatment, she is bleeding, possibly septic, another medical opinion is not immediately available What is the doctor's position in law if he proceeds to empty the uterus by surgical means?—We are, etc,

"Rachi-resistance" and Spinal Anaesthesia

SIR,—It is gratifying to find out that our short paper on rachi-resistance and spinal anaesthesia has aroused the interest of Mr Norman C Lake In the first paragraph of his letter (*Journal* February 6, p 297) he assures us that there is no "lack of knowledge of the ideas put forward many years ago by Sebrechts" We for our part would like to assure him that we do not think that other users of spinal anaesthesia are ignorant of these ideas and are at a loss to understand how Mr Lake could read this meaning into our opening paragraph Mr Lake also says "they [Black and Walters] fail to realize, however, that even with a perfect technique there are yet other sources of failure than the assumed idiosyncrasy" Near the beginning of our article we stated "Failure may also

MR J. E. STACEY (Sheffield) asked whether Dr Hunter had discovered anything about the time in the cycle at which these hormones should be used. He had seen good results in pruritus vulvae. He thought that many of the effects obtained by substitution therapy were the result of psychological influences. DR F. H. LACEY (Manchester) asked whether Dr Hunter had compared the results in repeated miscarriages with those obtained from anti-syphilitic treatment. His own results in the latter had been very good, and he used the treatment whether the Wassermann reaction was positive or not.

DR HUNTER replied that regarding the times of treatment he had used Kaufmann's table. Unfortunately they had not been able to afford the cost of the huge doses used by Kaufmann. In his opinion menstruation tended to continue so long as there was any hormone secreted. He thought that secondary amenorrhoea was due to a sudden cessation of hormone production. His series of repeated miscarriages had not revealed any history of syphilis. In most of his cases there had been a history of scanty menstruation. He believed that diet was a very important factor.

ACUTE ENTERITIS

A discussion on acute enteritis was held by the Fever Hospitals Group of the Society of Medical Officers of Health on January 30, with the vice-president, DR H. S. BANKS, in the chair.

DR ROBERT CRUICKSHANK (North-Western Group Laboratory, L.C.C.) emphasized the necessity of co-operation between the clinician and the pathologist in this condition. Material for examination must be sent to the laboratory at the earliest possible moment since invading pathogens were rarely found after the third or fourth day although in dysenteric infections the organisms concerned might persist occasionally for several weeks. If delay was inevitable 30 per cent. glycerin in 0·6 per cent. saline solution should be used as a preservative. The rectal swab should be more frequently employed. The patient's blood should be tested for specific antibodies between the seventh and twenty-first days. Although sometimes entirely negative the presence of specific agglutinins might confirm a diagnosis of Sonne or Flexner dysentery in cases when the stool examinations had proved to be negative; a titre of 1 in 10 to 1 in 20 in the former condition and of 1 in 50 in the latter would be diagnostic in children. Aetiologically infectious and non-infectious dysentery should be differentiated, although it was difficult sometimes to separate these forms on clinical grounds alone. In the first of these the most important infecting organisms were *B. dysenteriae* Flexner and *B. dysenteriae* Sonne; the first was usually associated with a true dysentery or ileocolitis; the second might cause gastro-enteritis or dysentery. The infectivity was often great and the spread was by human contact or convalescent carriers. Another important cause of infection was by the Salmonella organisms; animals were the main reservoirs of infection, the mouse being a not uncommon carrier of *B. aertrycke* (or *B. typhi murium*). Again *B. paratyphosus* B might be concerned in a gastro-enteritis. The importance of *Staphylococcus aureus* had been stressed particularly by American observers. This infection was often milk-borne and in the examination of suspected food bacteriologists should always look for this organism. Non-infectious gastro-enteritis might be divided into primary and secondary types, the former being synonymous with summer diarrhoea (epidemic enteritis and zymotic enteritis), while the latter occurred as a complication of measles and bronchopneumonia. Summer diarrhoea particularly affected artificially fed infants of the poorer classes during the summer or autumn months, the four factors of artificial feeding, infancy, unhygienic surroundings and high temperature combining to produce the disease. A raised external or internal temperature affected adversely the gastric and intestinal secretions so that in infants the initially low gastric acidity tended to be neutralized by the highly buttered cows' milk, and there was interference with the sterilizing mechanism in the stomach and upper part of the intestine. The consequent rising of coliform organisms from the lower bowel up to this virgin soil, associated possibly with bacterial infection of the food, prevented proper digestion and the general irritative action produced gastro-enteritis. The use of low-buffered acidified foods would probably help in the prevention and treatment of this type of enteritis. It was well to remember that breast-fed infants were almost immune.

DR M. MITMAN (Eastern Hospital, L.C.C.) said that in enteric infections in children diarrhoea was the pivotal symptom but parenteral infections and digestive disorders had to be excluded. Clinical diagnosis might often be difficult especially in infants in whom the typical syndromes might be replaced by those of gastro-enteritis. The diagnosis of parenteral infections depended upon the detection of the focus and in the other forms of diarrhoea differentiation was difficult in the absence of bacteriological and serological assistance. The practice at the Eastern Hospital in the past had been to segregate the dysenteries (almost exclusively Sonne infections) and to congregate the remaining cases in an enteritis ward. This heterogeneous group had been discovered to have a mortality rate ten times as high as that for the dysenteries. If as seemed probable these cases of enteritis included a number of infections of unknown aetiology it was not justifiable to nurse them side by side in an open ward. It was also illogical to segregate cases of dysentery with a relatively low death rate and to leave other infectious cases with a high mortality together. It was much more important to remove from an open ward a case of diarrhoea with a negative dysentery report than one with a positive finding. In the mixed group the mode of transmission was still uncertain. Infection by ingestion was probably the commonest method but there was evidence that some particularly those occurring in winter resulted in consequence of droplet carriage. This might explain the frequency of middle-ear and respiratory infections in some outbreaks of diarrhoea. It was proposed to treat in future all cases at the Eastern Hospital by a combined cell and diet-kitchen technique. Every case of enteritis whether primary or secondary to other infections such as measles and whooping-cough was to be considered as a separate infection from every other case. Patients were to be nursed in separate cells. Feeds were to be prepared in a special milk room by gowned masked and gloved nurses employing an aseptic technique. After use bottles and teats were to be sterilized in a special sterilizer in the kitchen and passed through a hatch into a drying chamber in the milk room. Scrupulous care was to be taken in the disposal of excreta. Destructible squares were to be used when possible. Sluicing of foul linen was to be avoided as far as possible; if unavoidable the nurse concerned would wear a rubber apron gloves and goloshes and would be forbidden to enter the milk room. By these measures it was hoped to minimize cross-infection in enteritis.

A Clinico-pathological Classification

DR DAVID HALER agreed with the two previous speakers but thought that his own views otherwise were heterodox to some extent. He favoured a clinico-pathological classification based upon the clinical examination of the child and a careful bacteriological investigation of the stools. Following a scheme set out in a paper read before the Edinburgh conference of the Royal Institute of Public Health last year he distinguished four groups. In the first there was a high mortality rate but no abnormality in the stools apart from their frequency. The child was overwhelmed by a severe toxaemia or perhaps septicaemia. The normal ratio of coliform to lactic acid

be due to the use of inactive solutions or very rarely to some pathological lesion such as a cord tumour This would seem to show an adequate realization that there are other sources of failure

With regard to the criticisms of the cases quoted about Case 2 Mr Lake says, 'it is common experience that secondary injections are subject to uncertainty if given immediately' In the 657 cases of which we have accurate records there have been fifteen cases in which after an interval of fifteen minutes adequate anaesthesia was not obtained and a second or third dose was given In fourteen of these a good result attended this procedure, the fifteenth being the case recorded With reference to Case 1, it is very unlikely that an individual would exhibit such idiosyncrasy to two anaesthetics as different in their chemical constitution as decicaine and percaine ' If Mr Lake would accept the possibility of undue resistance to the permeation of the drugs peculiar to the nerve sheaths of the individual, this is easily explained

Finally, it would seem that Mr Lake is not so sceptical about this condition as he would have us believe, surely a few fine adhesions in the arachnoid, an unusual arrangement of the dentate ligament scarcely provide a more concrete pathological explanation of a rachi resistant case than a variation in the permeability of the nerve sheaths, which we propounded—We are etc

Blood Group Tests in Disputed Paternity

SIR—Dr Harley and Dr Roche Lynch raise an important point in connexion with M and N grouping in their letter to the *Journal* of February 13 (p 357) In discussing the necessity for the strictest controls in this work, a point with which I am in complete agreement, they mention that the immune rabbit serum may contain group specific anti-A and anti-B agglutinins developed in response to the injection of the homologous cells This admittedly occurs when the animals have been immunized with AM or AN blood but it is even more important to realize that the same agglutinins may be present in the sera of animals which have been immunized with OM or ON blood.

The anti A agglutinin occurs normally in about 40 per cent of rabbits and the anti B in 15 to 20 per cent, the sera of the remaining 40 per cent failing to agglutinate any human cells The titre of these agglutinins ranges most commonly from 32 to 128 It is essential that this fact should be borne in mind so that the appropriate absorptions may be made even when OM or ON cells are used for immunization It is preferable to test the rabbits before injection rejecting those which contain the agglutinins, thus obviating any error from this source—I am etc,

Inhalational Therapy

SIR—The correspondence in your columns on inhalational therapy prompts me to mention that in 1911 I began to institute a London inhalatorium After visiting and examining the methods at Ems, Homburg Baden-Baden Mont Dore, etc, it seemed to me to be well worth attempting to form one I explained to a good many leading men what I thought of doing and they heartily agreed with me I have still the signed list of those interested who became supporters—namely, Sir James Goodhart, Sir StClair Thomson Sir Leonard Hill, Dr Arthur Latham, etc The scheme was printed and sent out to a number of likely subscribers several of whose names were given by Dr Latham But nothing came of it Money was not advanced and the thing collapsed

I have not had much experience of inhalation treatment, and have no reason to challenge the good work which the physicians have related to you But I may say that I agree most emphatically with your remarks on the necessity of having this practice first thoroughly examined by a competent staff (*Journal* February 13, p 360) One of my chief reasons is that I have found some asthmatic patients using a spraying machine I observed in two or three cases that they were quite unable to give up the inhalation using it day and night, and continuing it until their condition became hopeless, and they had to be sent to an institution It is therefore of high importance to know what to give in the inhalation, and how and when to use it—I am, etc

A G AULD

Psychological Factors in Rheumatism

SIR—I have been deeply impressed by Dr James L Halliday's articles on the psychological factors in rheumatism (*Journal* January 30, p 213 February 6 p 264) Ten years ago my interest in this approach to disability and disease was aroused by the work of my friend Mr W S Inman who was investigating the emotional factors in various functional, infective and haemorrhagic conditions of the eye I proceeded to apply his belief in "the language of the emotions to every kind of ailment and illness that came under my care as a general practitioner with amazing results for I found with monotonous regularity the precedence of a distressful state of mind in almost every case

Often the patients recognized and even called my attention to this precipitating cause of their ill health but I noticed that the more obviously neurotic or the very highly religious patient would often indignantly repudiate any such factor ' Psychological rheumatism of the severer types is hard indeed to dislodge, for it represents the expression of a profound and often unconscious personal disharmony Such a case is the following

In January 1933 a colleague sent me a young working class woman who had been on the panel for ten years with severe rheumatoid arthritis Fingers wrists ankles and knees were swollen deformed and rigid and she used to hobble in with a stick She had constant pain in the shoulders spine and other joints and had had every conceivable treatment

I saw her for an hour twice weekly for fifteen months for talks and superficial analysis Her mental improvement was remarkable her physical improvement was slower but received a great impetus when she went to the country for two weeks here she started walking for miles and using her hands On her return she took a post as general help signed off the panel and is still in whole time work after three years After working for a few weeks the swelling round the joints disappeared though when aroused by anger or jealousy large painful lumps would come up and last for a few days and on two occasions of emotional upset she developed a skin urticaria Both her wrists became loosened quite suddenly one during sleep and the knees also suddenly decided to bend one day in church having refused to kneel for ten years' This suggests that the swelling and rigidity of arthritis may be sometimes due not to ankylosis but to unconscious muscular action and some kind of chronic angioneurotic oedema

This illness started in a very acute fashion when the patient was in service with a mistress who she considered ill used her and treated her as a maid not as a member of the

bacilli was maintained as estimated by direct films Cultures showed no abnormality In the second group there was a rather lower mortality rate, the disease was less acute and was associated with focal sepsis The cardinal finding was a reduction in the lactic acid to coliform bacillary ratio The third group was a complex one, in it the infection was associated with cocci or bacilli actually attacking the gut, and it comprised the usual enteral infections The stools usually contained pus and blood The fourth group was associated with depression of the general bodily resistance by other diseases and the invasion of the gut by proteiform bacilli The prognosis in the third group was very good relatively, while in the fourth group it depended on the associated diseases Groups 1 and 2 were truly parenteral, group 3 and its subdivisions were enteral, and group 4 was secondarily enteral in character Dr Haler emphasized the extremely high infectivity of the true dysenteries and their relatively low mortality

Dr A. JOE (North-Western Hospital, L C C) stated that he proposed to use the method of cell isolation, including steps designed to exclude the possibility of droplet infection Those present, including himself would probably be somewhat unwilling to abandon the hypothesis of manual infection in explaining the spread of these diseases, but the work of W F Wells in America, if confirmed, would reopen the whole question of air-borne infection and introduce a new conception of this method of spread Under experimental conditions Wells had shown that intestinal organisms had maintained their viability in air currents when attached to droplet nuclei, and these might account for such a rapidly spreading outbreak as had been already described in Bristol by Parry and Peters He himself had had one such experience, but had been unable to exclude the possibility of food contamination by a ward maid who had had an acute attack of diarrhoea three weeks before the outbreak this attack had not been disclosed until a rapid succession of cases of Sonne dysentery had caused the fullest inquiries to be made

Dr J S ANDERSON (Grove Hospital, L C C) agreed that it was important to decide whether diarrhoea was infectious Since it was sometimes impossible to differentiate, every case of diarrhoea should be isolated as being potentially infectious He mentioned an outbreak of twelve cases of Sonne dysentery, among which was that of a child 10 months old, to whom attention had been drawn by the passage of one green motion without there being any other signs or symptoms That green motion had been found to contain the Sonne bacillus He stressed the need of paying more attention to the anal toilet in children's wards, and of the staff reporting even the slightest attacks of diarrhoea in themselves

Dr D S SUTHERLAND (Manchester), recalling war experiences, suggested that amoebae might be the cause of recurrent diarrhoeal attacks in this country A mild but highly infectious outbreak of dysentery had occurred during October to December in Monsall Hospital, the cases being mainly confined to two wards, though occasional cases had appeared in others Of the forty-five cases forty-one involved patients and four were in nurses There were no deaths or severe illnesses, the main feature was the occurrence of frequent, relaxed, and offensive stools In thirty-one cases mucus was present in them, and in eighteen there were blood streaks, though no altered blood The organism isolated was of the Sonne type, and the original source was not detected Dr Sutherland was inclined to think that as regards the source of such outbreaks the organization of the hospital kitchen was an important factor In the storage of food dust originating from earth attached to unprepared vegetables might easily infect the food supply and he stressed the necessity of completely separating the preparation of food, particularly vegetables from its cooking It was important to ensure that minced meat was used up on the day of cooking and not added to the next day's supply

ASSESSMENT OF DISABILITY IN MINERS' NYSTAGMUS

The proposition "That the institution of medical boards would be an advance on single referees in cases of miners' nystagmus" was debated at a recent meeting of the North of England Ophthalmological Society held at Leeds The feeling of the meeting was against the proposition, which was lost by a large majority

In Favour of Medical Boards

Mr HERBERT CAIGER of Sheffield, the principal speaker in support of the motion, pointed out certain basic facts to be borne in mind in connexion with miners' nystagmus The great majority of miners working at the coal face were affected by it as they grew older, but they were not disabled, and many were quite unconscious of the oscillations of the eyes and had none of the associated symptoms Only a small minority were seriously disabled and a few completely and distressingly disabled There was no generally recognized and satisfactory method of readily distinguishing the serious cases from the others, and the ophthalmic medical referee was presented with a problem of great difficulty The leading symptom—oscillation of the eyes—came, it was true, within the province of the ophthalmic surgeon, but in many cases the disabling symptoms were dizziness, headache, or other troubles which the physician was better qualified to assess, and yet, even when oscillations of the eyes were absent it had been the custom to refer these cases to the ophthalmic referee The decisive factor which determined the question of disablement was not the presence of oscillations but the failure of the nerve centres concerned to inhibit their disabling consequences The problem was a neurological, not an ophthalmic, one, and the case was clearly one calling for team work, with the ophthalmic surgeon and the physician bearing a more or less equal share of responsibility He sketched the points which would come within the province respectively of the ophthalmic examiner and of the physician In diagnosing the presence of the disease the chief responsibility seemed to fall upon the ophthalmic surgeon, but in assessing the disablement the physician should have at least an equal voice He also referred to the considerable dissatisfaction with regard to single referees chiefly owing to the diversity of opinion In one district the referee would certify as fit for work at the coal face men who still showed oscillations, and in another the referee would take the view that a man who had once had nystagmus should never return to the face, however complete his recovery A single ophthalmic referee's decision ought not to be final and without appeal A system similar to the medical boards that regulated pensions after the war would restore public confidence

In Favour of the Single Referee

The motion was opposed by Mr JOHN FOSTER of Leeds who said that the question had arisen because miners were aggrieved that re employment had been refused to men with an idiosyncrasy to nystagmus and light work refused to men who were recovering Both these matters were outside the sphere of the medical profession There was also dissatisfaction with the view of individual referees The estimation of disability in this disease was unquestionably very difficult because of the variability of the signs of the disease from time to time in the man affected the fact that every other miner over the age of 50 had oscillations without incapacity, and that nystagmus might produce a neurosis which disabled a man long after the oscillations had disappeared All this allowed for a great many shades of opinion, and it was often the case that referees might disagree with the usual finding of judges in their area If the proposed committee were formed of whom would it consist? A psychiatrist would probably be the first choice but he suspected the psychiatrist would merely develop his own formulae for the disability or perhaps not alter them at all A physician would be added for his opinion on the arteriosclerotic aspect of

family, and she has refused to submit to the indignity of uniform ever since She had a severe character neurosis, exhibiting intense resentful pride, self pity, and jealousy, and had a tremendous struggle to overcome the desire to return to the position of the helpless and pitied invalid

During the first two years of her treatment I came up against much hostility in helping her to face "the consequences of becoming well" Of course she is not fully cured of her character defects or neurotic tendencies, and has still some limitation of hand movements, but at least she is now a happier, self-respecting, and self-supporting member of the community instead of being a charge upon the State—I am, etc,

Southsea, Feb 14 OLIVE B SHARP, M B, B S

Prevention of Silicosis

SIR,—In my turn I am obliged to Dr J A Goodfellow for pointing out the facility with which iodization of the atmosphere may be carried out I am enlightened also by the description of the experiments which he has made and proposes to make with the object of demonstrating the potency of his method in prophylaxis against Koch's infection It is a method which would certainly appear to have far-reaching possibilities, since the infection occurs in confined spaces which would lend themselves readily to iodization, but the question of iodine sensitization, possible harmful effects from absorption, and other similar questions would require and no doubt receive careful consideration and experimental control Some degree of absorption may, of course, be desired, and after reading Dr Goodfellow's letter I was left wondering whether the success of the method is presumed to depend on the effects of the iodine absorbed or on disinfection of the atmosphere prior to inhalation I imagine the latter, although the former would appear more likely to be the event in the sterility cases, unless these suffered from pulmonary infection before treatment

I trust Dr Goodfellow will in due course favour us with the results of his investigations, I shall await these with interest—I am, etc,

London, E 1, Feb 15 A L CRADDOCK

The Transit of Pregnant Women by Air

SIR,—The question of the transit of pregnant women in aeroplanes has come up for consideration, and is one of importance to the medical profession as well as to the general public Several factors are involved, such as the distance to be travelled and the facilities which exist for medical aid at the landing grounds, as well as the condition of the patient herself The rules formulated would presumably differ for those flying within European limits and for those flying across Africa or Asia or to Australia, and tentatively one might suggest a limit of one clear month from the expected date of delivery in the former and two months for the long distance passengers I should be grateful to members of the profession who would give their views on this question, either in the columns of the *Journal* or in private correspondence—I am, etc,

Stafford Road Wallington Surrey Feb 12 F P MACKIE, Colonel I M S (ret), Medical Adviser Imperial Airways Ltd

A report of Sir Francis Fremantle's Chadwick Public Lecture The Doctor's Mandate in Parliament," appeared in these columns on December 5, 1936 (p 1157) The full text of the lecture, with an account of the discussion following it has now been published in pamphlet form by P S King and Son, Ltd, Orchard House, Westminster (price 6d)

Obituary

W S PAGET-TOMLINSON, LL D, M D, F R C P

Kirkby Lonsdale

Dr W S Paget-Tomlinson, one of the best-known figures in Westmorland, died on February 8 in his eighty ninth year at his home, The Biggins, Kirkby Lonsdale He is survived by two sons and a daughter, Colonel W Paget Tomlinson, Dr E E Paget-Tomlinson, and Miss A M Paget-Tomlinson

Born at Forton, near Lancaster, in 1848, he was the youngest son of Thomas Paget, who died in 1852 Destined for the medical profession, he began his studies at the Liverpool School of Medicine in 1866 and worked under the late E A Bickersteth in the old Royal Infirmary From Liverpool he went to University College, London, taking his diplomas M R C S, L R C P, and subsequently the M B, Ch B Lond in 1871 For a time he studied in Berlin and Vienna, and on his return to England practised at Blundellsands in the neighbourhood of Liverpool, and while in active practice obtained the M D Lond and in 1883 became M R C P Able, alert, kindly, and energetic, he rapidly built up a sound practice, which he reluctantly abandoned in 1889 after eighteen years, when he succeeded to the estates of the late Miss Elizabeth Tomlinson, and by Royal Licence changed his surname from Paget to Paget-Tomlinson Professor Lyon Blease, as public orator, aptly said in 1934, on the occasion of the granting of the honorary degree of LL D to Dr Paget-Tomlinson by Liverpool University "He was compelled by a change of circumstances to retire, but only from one active life into another When he assumed the responsibilities of a Westmorland landowner he showed that in changing his home he had suffered no change of spirit" He was then the oldest known former medical student of the Liverpool Medical School of the 'sixties In 1924 the Royal College of Physicians of London indicated its appreciation of his work in Westmorland by electing him a Fellow

His training in medicine and his eighteen years in general practice had peculiarly fitted him for the new sphere in which he found himself, and his special knowledge, ability, energy, tenacity, and tact found full scope It was not long before this was recognized In 1890 he was appointed a magistrate and in 1897 was High Sheriff and received the Queen's Jubilee medal From 1896 he became a member of Westmorland County Council, and in 1906 chairman of the Agricultural and Diseases of Animals Committee, and in this position took special interest in anthrax and bovine tuberculosis In 1908 he became chairman of the new Committee for School Medical Inspection, and from that time onwards education occupied his earnest attention When the question of dental treatment for school children arose he provided the funds for an experimental trial of two years' dental care and supervision to all the children attending the Kirkby Lonsdale Elementary School The results were so satisfactory that he successfully urged the appointment of a whole-time dental surgeon

For many years he was one of the governors of Sedbergh School, and up to the time of his death chairman of the Queen Elizabeth School and that at Casterton In furthering their best interests he spared neither himself nor his money One of his most ambitious and valuable endeavours was the establishment of the Westmorland Sanatorium for Consumption at Meathop His partner in this was Dr W R Parker of Kendal It is noteworthy

these ageing men, but the ophthalmologist's knowledge of giddiness arising from cerebral arteriosclerosis was as good as a physician's and he was able to detect its first sign (in the fundus) with greater accuracy If a physician were added to such a committee he was bound to dominate it The training of an ophthalmic surgeon put him at a disadvantage where there was a gross difference between signs and symptoms Miners nystagmus was the only disease in which the ophthalmic surgeon was an expert in dealing with this divergence But the whole of the specialist physician's training was devoted to this particular type of explanation, and the ophthalmic surgeon would soon find himself in a secondary position The next debate—if this were handed over to a board—would be one in which physicians would decide whether ophthalmic surgeons need see these cases at all The board would presumably include other oculists, which would certainly diffuse the odium of an unpopular decision and be in line with the present demand for impersonal judgements on all sorts of matters but it did not follow that the opinion of a committee of oculists was necessarily sounder than that of an individual As matters stood the ophthalmic referee could have a second (physician's) opinion in any particular case on a letter to the Home Office

As already stated the general feeling of the meeting *was against a board or committee The question is one* which is now being considered by the Departmental Committee on Miners Nystagmus

SUBCLAVIAN ANEURYSM

At a meeting of the Section of Surgery of the Royal Academy of Medicine in Ireland on February 5 with the president Mr A A McCONNELL, in the chair, Mr C J McAULEY showed two cases

Mr McAuley said the first case was a female patient, who in 1933 had suddenly developed pain and pulsation in her right arm In due course there was loss of power A swelling about the size of an egg could be seen above the right clavicle, there was no bruit, the blood Wassermann was negative and x ray showed the heart to be quite normal, the radial pulse could not be felt The swelling proved to be a subclavian aneurysm and was treated by ligature of the innominate artery after removal of the right half of the manubrium sterni The carotid was not ligatured Mr McAuley stated that there were only about sixty cases of this condition on record, and of these three had been successfully operated upon in Dublin Mr J J FITZSIMONS said that it was very interesting to see a fusiform aneurysm of a non specific nature The case showed that good surgery depended to a large extent on sufficient exposure

Thrombo angiitis Obliterans

Mr McAULEY also showed a case of thrombo angiitis obliterans The patient a man of 36 said that in 1934 his right foot began to feel cold and numb in the morning later it became extremely painful He also felt numbness of two or three fingers of his right hand when swimming He was admitted to hospital in 1935 when no pulse could be felt in the right radial artery nor in either anterior or posterior tibial arteries He improved somewhat after treatment, but returned in 1936 when the condition had become very much worse and the big toe showed signs of gangrene Lumbar sympathectomy was performed and after removal of the big toe the gangrene did not progress and the temperature of his foot came back to normal The PRESIDENT referred to the very rapid onset of the condition in this case He asked if there was any effect from the injection of novocain into the posterior tibial nerve Mr J J FITZSIMONS asked was it not very unusual for spasms to occur in the upper and lower limbs at the same time? To him the case would rather suggest a type of Raynaud's disease Mr T A BOUCHIER HAYES referred to two cases of this disease which he had recently seen He asked if a vasomotor index had been taken in the present case Mr F J MORRIN said that no one could state what were the indications for treatment in this case since its cause was not known Efforts at treatment were directed to enhancing the collateral circulation It had not been definitely established that operation on nerves was the ideal treatment Mr A B CLERY asked if spinal anaesthesia had been tried in this case, as it was supposed to give a good indication as to the probable result of sympathectomy He referred to a recent paper in which cases were described which had been treated by excision of the tibial nerves Professor W J JESSOP asked how the skin temperature had been taken It was said that the only really accurate way of doing this was by the electric method which was very troublesome He had used the test mentioned by Mr Clery giving the patient a spinal anaesthetic and afterwards taking the temperatures in the healthy and diseased limbs Dr E HARVEY said that tobacco had been suggested as a possible cause of the disease and although this idea had now been given up, it was interesting to note that the present patient was a very heavy smoker Mr J C FLOOD asked what was Mr McAuley's view regarding prognosis He thought a diagnosis was very difficult to establish, and said that skin thermometers of any sort had been proved to be rather unreliable He suggested the giving of acetylcholine in the early stages Mr McAULEY in reply, said that it was very difficult to know what one could promise in the way of prognosis Injections of novocain had no effect whatever He felt that the case was definitely not one of Raynaud's disease

Local News

SCOTLAND

Carnegie Trust for the Scottish Universities

At the annual meeting of the Carnegie Trust held on February 10 it was stated that an unusual feature had been the exceptional number of resignations of Fellows and Scholars due to appointments Out of thirty two Fellows and Scholars in organic and physical chemistry nearly one half had resigned and it was believed that this was due to the revival of prosperity in the chemical industries The report of the superintendent of the laboratory of the Royal College of Physicians of Edinburgh a laboratory largely financed by the Trust shows that during 1935–6 sixteen workers were engaged in medical research within the laboratory Sir H Arthur Rose chairman of the Trust, stated that in the past year 3 735 students received sums amounting to £56 279 in respect of tuition fees or 41 72 per cent of the funds available He believed that this was a fair proportion as between the main objects of the Trust which were the payment of fees for necessitous students the support of the universities and the encouragement of research The capital sum allocated in grants to universities and extramural institutions was £45 460 or 33 68 per cent of the total while research accounted for £19 000 or 14 14 per cent Lord Macmillan, referring to what had been done by the Trust to improve the general condition of students said that people interested in education now seemed to be chiefly concerned over nutrition and physical exercises While it was very desirable that students should be physically fit there was a danger that we might fuss a little too much over the physical condition of young men and women He intended this merely as a word of warning, and not in any way in derogation of the schemes now so widely advertised The Trust had been doing a good deal in support of the students unions which

that there was no such sanatorium for the poor at that time in England the Mouthop institution was the pioneer He was intimately associated with its activities and its development, towards which he was a liberal contributor, and he was its president at the time of his death It was opened by the late Lord Derby in 1900, and it stands as a permanent memorial to the foresight and public spirit of Dr Paget Tomlinson

No reference to Dr Paget Tomlinson would be complete if mention were not made of his intense love of music Wherever he lived he took a leading part in its musical life more particularly that of its choral societies He was choirmaster of Kirkby Lonsdale Parish Church up to his death and president of the Choral Society Nature had endowed him with a fine mellow voice, which constant practice had preserved in a remarkable manner Gentle and sympathetic it was natural that he should love animals and children He was the author of a small book entitled *Kindness to all Created Things* and the well known quotation with which he begins gives us the key to his life

> I shall pass through the world but once any good thing therefore that I can do or any kindness that I can show to any fellow creature or dumb animal let me do it now let me not defer it nor neglect it I shall not pass this way again

Dr Paget Tomlinson joined the British Medical Association as long ago as 1873 On his 80th birthday a presentation in recognition of his public services was made to him by the inhabitants of Kirkby Lonsdale and his tenants in Westmorland, Lancashire, and Yorkshire

THEODORE JUST, M.B., F.R.C.S.

Aural Surgeon in Charge of Out-patients St Bartholomew's Hospital

We regret to announce the death on February 13, of Mr Theodore Just after a long illness from which at one time he seemed to have made recovery

Theodore Hartmann Just was born in Bristol on April 23, 1886, the only son of the late Sir Hartmann Just, K.C.M.G., C.B. From St Paul's School where he distinguished himself alike in work and play, he went to Trinity College, Cambridge, in 1905 as an exhibitioner At Cambridge he gained a blue for athletics, representing the University in the half-mile and mile races against Oxford, and was president of the C.U.A.C. in 1908, in which year he won the amateur half-mile championship of the United Kingdom and took part in the Olympic games After obtaining his B.A. degree, with first class honours in the Natural Sciences Tripos Just went on to St Bartholomew's, winning the half-mile in the United Hospitals Sports four years in succession He qualified M.R.C.S., L.R.C.P. in 1910 and held in succession the posts of house surgeon, house surgeon to the throat, nose, and ear department, and demonstrator of pathology at Bart's He graduated M.B., B.Ch. at Cambridge in 1912 On the outbreak of war he joined the R.A.M.C. as a temporary lieutenant, and returned to civil life in 1919 with the rank of major, in that year he obtained the F.R.C.S. Specializing in oto-rhino-laryngology he was soon appointed *surgeon to the Throat Hospital, Golden Square*, and some years later assistant aural surgeon to St Bartholomew's and assistant surgeon to the throat nose and ear department of the National Hospital, Queen Square He also became consulting aural surgeon to the Lord Mayor Treloar's Hospital for Cripples at Alton to the Foundling Hospital, and to the Harrow Hospital, and consulting surgeon to the ear and throat department of the West Suffolk General Hospital, Bury St Edmunds

Just was honorary secretary of the Section of Laryngology and Otology at the Annual Meeting of the British Medical Association at Bradford in 1924 and vice-president of the same Section at the Bournemouth Meeting ten years later During his war service he contributed *notes on the bacteriology of wounds to the Journal of the R.A.M.C.* and afterwards wrote on the treatment of collapse following operation on the tonsils in the *British Medical Journal* He also published papers on otological subjects in the *St Bartholomew's Hospital Reports* and the *Proceedings of the Royal Society of Medicine* His death at the age of 50 is a loss to the specialty in which he had done admirable work, and to a wide circle of friends and colleagues

Mr H. B. STALLARD writes

The death of Mr T. H. Just is not only a tragic loss to his friends and his profession but also to athletics He was president of the C.U.A.C., and in 1908 won the half-mile for Cambridge against Oxford in 1 minute 55 4/5 seconds a remarkably fast time under such weather conditions that exist in March, when the inter-university sports are held In the same year he was amateur half-mile champion and represented Great Britain at the Olympic games held in London His athletic prowess continued during the time he was a student at St Bartholomew's After he had relinquished active participation in athletic sports he continued to show a constant and faithful interest in the inter-university sports, the inter-hospitals annual athletic contest St Bartholomew's sports and other such events, at which he was often seen in an official capacity as a referee judge, timekeeper or starter His generosity in giving much of his valuable time to these causes *his constant cheerfulness and fund of good* humour earned him great popularity among many generations of young and old athletes who will always remember him with very genuine appreciation and warm affection To them his loss is irreparable

Dr HENRY THOMAS SAMUEL, D.S.O., formerly of Newport Road, Cardiff and late A.D.M.S. of the 53rd Division, died at his residence in Bournemouth on *January 10 at the age of 57 Born in Merthyr Tydvil* he received his medical education at University College, Cardiff and at St Bartholomew's Hospital In 1903 he obtained the diplomas M.R.C.S., L.R.C.P. and his earlier appointments included those of assistant house physician house surgeon, and resident medical officer at Cardiff Infirmary He then engaged in private practice in Cardiff and removed to practise in Bournemouth two years ago He joined the *Cardiff Volunteers in 1906* and *from 1908* until the outbreak of war held the commission of captain, R.A.M.C.(T.) in the 2nd Welsh Field Ambulance *In 1914* he was mobilized with his unit, and was promoted to the rank of major In *1915* he went to Gallipoli as second in command, took part in the landing and evacuation of Suvla Bay, and was promoted to command the unit in November of that year He subsequently served with it in Egypt and Palestine was mentioned in dispatches and was awarded the D.S.O. With the exception of one short period of leave in January 1917 he served overseas from 1915 to 1919 At one time he commanded the 117th Indian Combined Ambulance in Palestine and towards the end of the campaign was *A.D.M.S. of the 53rd* Division After demobilization he held the post of medical referee to the Welsh Region of the Ministry of Pensions For twenty-five years he had been a member of the Territorial Force retiring in 1934 with the rank of colonel In his civilian life he was a very popular practitioner first in Cardiff and latterly in Bournemouth For many years he was a clinical assistant in the out-patient department of Cardiff Royal Infirmary, and as

formed a very important feature of Scottish university life, and attention had also been paid to the physical aspect by aiding provision for athletics

Edinburgh Dental Students

The Edinburgh Dental Students Society held its annual clinical at-home on February 5 This included an address by Dr Sydney Blackman, radiologist to the Royal Dental Hospital, London, on ' Dental Radiography," and various demonstrations dealing with aspects of dental work At a luncheon it was decided to form a National Dental Students Society of Great Britain to be carried on under a regional system with centres in Edinburgh, Leeds, and at Guy s Hospital in London The objects of the society will be to facilitate intercourse among dental students throughout the country in the interests of dental science and also of their own welfare, and it was agreed that conferences of the new body should be held every two years At a dinner held in the Roxburghe Hotel Mr A C W Hutchinson, dean of the Edinburgh Dental School, replying to the toast of this school, said that in 1892 there were only thirty students, but to-day there were 260 on the roll, and the work of the hospital had increased correspondingly Some parts of the hospital and school were badly in need of renovation and reconstruction was to be undertaken accordingly Professor Sydney Smith, dean of the Faculty of Medicine at Edinburgh University, proposing the toast of "The Edinburgh Dental Students Society,' said that this was the oldest society of dental students in the British Empire Fifty years ago it had consisted of twenty members, but now the membership exceeded 150 The society was second in size to that of Guy's Hospital, but it might still be extended Mr T L White, president of the society, in replying, said that one of its latest achievements had been to secure, with the co operation of the board of governors, a sports ground and pavilion on the outskirts of Edinburgh

ENGLAND AND WALES

Recreational and Athletic Gymnastics

A gymnastic demonstration organized by the English Gymnastic Society (founded in 1934 to further the interests of recreational gymnastics in England) was given at the Albert Hall, London, on February 6 In addition to a display by a team of English women, a party of Danish men—farmers in everyday life and leaders of village gymnastic classes in Denmark—under the leadership of Mr Niels Bukh, from the Gymnastic High School, Ollerup, carried out a series of exercises in a faultless manner Mr Niels Bukh has created a new method known as Danish primary gymnastics, a modification of Ling which has influenced the gymnastic teaching for men in a number of countries It was stated that since 1920 the courses at Ollerup have been taken by 5,000 women and 4,000 men leaders The women, who gave an equally effective demonstration under the leadership of Miss Gladys Wright, have been members of weekly gymnastic classes arranged by the English Gymnastic Society Their training has been based upon the principles of the Swedish system following the Elli Bjorksten modern method of gymnastics for women, adapted to suit conditions in England Those who took part were London professional and business women, their ages ranging from 19 to 47 They accomplished many difficult exercises with precision, and gave a very graceful exhibition of the rhythm of movement Lord Dawson in a short speech said that the British people were bad starters but good stickers, and now that the need for physical education had been brought home he was sure that, with their customary ability to adjust themselves to new situations, they would quickly make up any leeway One reason why physical fitness was more important to day than ever before was the declining birth rate, which meant that quality was becoming more important, and quality was not to be attained without planning Another reason was the constant urbanizing of the population, with the need for compensating for the ill effects of the cramped life in towns Then industry was constantly becoming more specialized which meant that there was a tendency for the overuse of one part of the body and the under use of the body as a whole He pointed out the rhythm, the balance and the ease of the gymnastic movements the audience had witnessed, and said that physical culture trained not only body but mind, enabling those who undertook it to be more understanding, receptive, and adaptable, fortifying them also against the storms of life He welcomed warmly the Danish guests Mr Niels Bukh, he said was a genius who had sprung from the Danish countryside, and not only a genius but a man of purpose and determination a prophet who had shown the people of his country that health and happiness were within their reach through physical training But Denmark must not be allowed to monopolize Niels Bukh , he was a leader whose influence had extended to many lands The Danish Minister also addressed the gathering referring to the many ties between his country and England

Manchester Royal Infirmary

Sir Walter Cobbett in his address as chairman at the annual general meeting of the Manchester Royal Infirmary on February 12 protested vigorously against the proposal of the Ministry of Labour and the Office of Works to erect a large labour exchange which will overshadow the Infirmary s central branch in Roby Street This branch which relieves the Infirmary of twenty urgent surgical cases each week has fifty-four beds It seems that the proposed labour exchange will restrict the access of light and air to the wards and render them completely unsuitable for the present purpose The financial burden of replacing these fifty to sixty beds will be considerable especially in view of the deficit of £23 812 on the last year s working which brings the total of the Infirmary s debt up to £79,817 The *Manchester Guardian* describes the proposal to build the new labour exchange alongside the Roby Street Branch as "a piece of thoughtless bureaucracy"

Deep X-Ray Department at Samaritan Hospital

A new department for deep x ray therapy, costing £8,000 and fully paid for, was opened by Viscount Dawson of Penn at the Samaritan Hospital, Marylebone Road London, on February 12 Dr A W Oxford, chairman of the hospital, presided over the ceremony Sir Eu Maclean, president of the British College of Obstetricians and Gynaecologists, in a few preliminary remarks referred to the spirit of progress which had always characterized the Samaritan In gynaecology the special hospitals, and the Samaritan in particular, had been pacemakers to the London hospitals in general This was true of the Samaritan alike in respect to its surgery and to its nursing and this new radiological department was another instance of its enterprise No radiological department to-day could claim to be fully equipped if it did not include an installation for deep therapy There was a large class of cases—benign chiefly—which could be treated better by x-ray therapy than by radium, and another large class in which radium treatment was quite properly given in the first instance but was supplemented by x ray treatment Both these agents in unskilled hands could be extremely dangerous, but rightly used any ensuing morbidity or result was likely to be less marked with x ray therapy than with radium Deep x-ray therapy should certainly be available, either as an adjunct to radium or, in some cases, as a substitute for it

Viscount Dawson of Penn, in declaring the department open, said that the Samaritan Hospital, now approaching its centenary, had been remarkable for its enterprise and courage all through its history He mentioned some of the great surgeons and gynaecologists who had been

such was in the most cordial relations with the remainder of the staff, his great clinical abilities being allied to unfailing loyalty, insight, and sympathy In 1903 he married Clari Selkirk, daughter of the late William James Selkirk of Cheltenham, and is survived by his widow, two sons, and a daughter He became a member of the British Medical Association in 1906 He was buried in Cardiff, the funeral being attended by a large gathering of his professional colleagues and many other friends

We regret to learn of the death abroad of Dr FREDERICK ERNEST WITHERS of Bradford-on-Avon, who had been a member of the Representative Body of the British Medical Association at the Annual Meeting in 1914 He was born at Barnstaple in July, 1868, and studied medicine at St Bartholomew's Hospital, where he distinguished himself in anatomy After obtaining the M R C S and L R C P diplomas in 1892 he served in turn as house-surgeon at Bart's and chief assistant in the skin department, and as surgeon to the Reading Dispensary From 1915 to 1919 Ernest Withers was on active service in France as officer in charge of the Medical Division of No 9 General Hospital, and afterwards as registrar and liaison officer at the same unit when it became the Lakeside General Hospital of the U S Expeditionary Force He attained the rank of major R A M C (T A) and was mentioned in dispatches, and for four years after the war held the post of medical superintendent of the Ministry of Pensions Hospital at Netley

Dr DAVID LAWRIE died on February 13 at his home in Grosvenor Crescent, St Leonard's-on-Sea He was born at Kilmarnock in 1860 and from Kilmarnock Academy went to study medicine at the University of Glasgow, graduating M B and C M in 1881 From 1891, the year in which he obtained the Cambridge D P H, until 1899 he was medical officer of health and police surgeon for Kilmarnock Burgh, assistant physician to the local infirmary, and surgeon-captain in the Ayr and Galloway Artillery Volunteers During the South African War he was for a time civil surgeon at Netley Hospital Dr Lawrie afterwards settled at Glastonbury becoming M O H under the urban district council and certifying factory surgeon for the district He had been a member of the British Medical Association for fifty-four years

Dr JULES FREDERICK REY, who died at Bognor on February 13, was born at Ashford, Middlesex, in 1879, and spent his schooldays at Boulogne He studied medicine at Guy's Hospital, qualifying M R C S, L R C P in 1904 after which he served for two years as resident medical officer to the Royal Boscombe and West Hants Hospital Bournemouth Actively interested in various departments of medical science and a frequent contributor to medical journals, Dr Rey combined general practice with work in radiology and electrotherapeutics He was a member of the Roentgen Society, and joined the British Medical Association immediately after qualification In recent years he was one of the honorary medical staff of the Bognor War Memorial Hospital

Dr ALFRED LLEWELLYN PERKINS who died on January 28 was born at Garnant Carmarthenshire in 1857 He studied at St Thomas's Hospital and Edinburgh University and qualified as L R C P and L R C S Ed in 1881 After practising some while in Wellingborough Northants, he became the first resident doctor in Sketty Swansea, where he carried on his practice for forty-six years, retiring in April 1933 During that time he held various public appointments among these being medical officer under the Swansea Board of Guardians During the war in addition to doing the work of three practices he acted as medical officer to the troops stationed in Sketty and Swansea Dr Perkins was a very keen sportsman and played cricket for the Surrey colts, and later for the Sketty team, which he captained He was the oldest member of the Swansea Cricket and Football Club He was a keen member of St Paul's Church, Sketty, where he was a sidesman for a number of years He joined the British Medical Association in 1891

Dr FREDERICK WILLIAM ROBERTSON of Bletchingley, Surrey, died on February 9 after a few hours illness He was born in Renfrewshire on December 24 1866 and was educated at the Glasgow Academy After graduating M A of the University of Glasgow in 1888 he came to London to study medicine at St Bartholomew's Hospital He obtained the English Conjoint diplomas in 1895 and the M B and B S Lond degrees with honours in 1897, proceeding to the M D two years later At St Bartholomew's he was house-surgeon and clinical assistant in the throat department, and then served as casualty officer to the East London Hospital for Children (now Princess Elizabeth of York Hospital for Children) Dr Robertson started work at Bletchingley in 1909, and had held appointments as M O H for the Godstone Rural District medical officer to the Isolation Hospital and the Union Infirmary, public vaccinator, and medical officer to the Post Office For his services in the war he received the O B E He joined the British Medical Association immediately after qualifying and remained a member for some years after retiring from active practice

We regret to record the death in London on February 11 of Dr JOHN MAXWELL GOVER, D S O, T D at the age of 59 Dr Gover received his medical education at Newcastle, and graduated M B B S of the University of Durham in 1898 He proceeded M D in 1922 He then came to London to St Bartholomew's Hospital, and took the diplomas of M R C S, L R C P in 1900 His early appointments included those of house-physician at Brompton Hospital, house-surgeon and house-physician at the Royal Victoria Infirmary, Newcastle, and assistant demonstrator of anatomy and physiology in the Newcastle College of Medicine Dr Gover joined the British Medical Association in 1903 and held office as chairman of the Newcastle-on-Tyne Division in 1925-6 He was keenly interested in the Territorial Army and at the time of his death held the rank of lieutenant-colonel, R A M C T A He served in the war of 1914-18, and received the D S O in 1918 and the Territorial Decoration in 1924 The funeral took place at South Gosforth on February 15

The Services

ARMY MEDICAL SERVICES

The War Office announces that Dr H Letheby Tidy has been appointed Honorary Consulting Physician at the Queen Alexandra Military Hospital, Millbank in succession to Colonel A G Phear, C B, whose tenure of appointment has expired

DEATHS IN THE SERVICES

Lieut Colonel RONALD WILLIAM EDWARD HUNTLY NICHOLSON R A M C (ret) died at Wokingham on November 23, 1936 aged 79 He was born at Exeter on May 2 1857 was educated at King's College Hospital and took the M R C S in 1879, the L R C P Ed in 1880, and the D P H of the Royal Colleges in 1903 Entering the Army as surgeon on July 31 1880, he became lieutenant colonel after twenty years service and retired on April 16 1902 He served on the North West Frontier of India in the Chitral campaign of 1895 taking part in the relief of Chitral and getting the Frontier medal and in the South African War in 1899-1901 when he took part in the relief of Kimberley in the operations in the Orange Free State including the actions at Paardeberg Poplar Grove and Driefontein and in operations in the Transvaal receiving the Queen's medal with four clasps He rejoined in December, 1914, for service in the war of 1914-18

associated with it, especially Spencer Wells, its surgeon for twenty years and afterwards consulting surgeon, whose tradition, he said, lived on at the Samaritan. Medicine and surgery were making great strides. Lack of advertisement must not be taken to mean lack of achievement. By tradition in this country the profession did not rush into print or blow its own trumpet on every occasion. It made progress through a wise restraint, and anything like premature publicity within the profession was decried. Only when a discovery was sufficiently advanced was it announced, and then it was submitted by the discoverer to his colleagues in the profession for their criticism. Such caution and prudence in the long run was for the good of the public, otherwise the public would be constantly made the prey of false hopes. He congratulated the Samaritan on its enterprise in putting in the new installation to forward what was now becoming an established method of treatment. The vote of thanks to Lord Dawson was proposed and seconded respectively by Mr William Gilbatt and Dr Russell Reynolds.

Medical Treatment of London School Children

The arrangements of the London County Council for the medical and dental treatment of school children for the year beginning April 1 next follow the proposals generally approved for the present year. Further provision is to be made, however, for the treatment of cases of squint, including the additional employment of orthoptists working under the supervision of ophthalmic surgeons. For the treatment of minor ailments an additional centre is to be opened in a Council school at Balham. This centre will also be utilized as an extra one for the supervision of children suffering from rheumatic affections. During the present year the age group 11 years has been included in the arrangements for dental inspection. It is now proposed that school entrants and leavers shall be included which will complete the arrangements for the inspection of children by the dentists, as contemplated by the three year programme. The Council will also enter into arrangements, where metropolitan borough councils so desire, for the medical inspection and treatment at school treatment centres of children under the age for compulsory attendance at school provided that the borough councils concerned are prepared to reimburse the Council the actual cost of treatment. A grant of £400 is to be made to the London Child Guidance Clinic. The cost of the arrangements for medical and dental treatment for 1937–8, apart from administrative charges, will be £123,308, an increase of about £3,000 compared with the estimate for the current year.

H. Herscovici (*These, Paris*, 1936, No. 806), who records seven illustrative cases, states that the frequency of occupational chancres in doctors and medical students is greater than might be supposed, as most of the cases occur in private practice, and a considerable proportion of them are not recorded. Syphilologists are not affected more often than other specialists, but it is rather the obstetricians and oto-rhino-laryngologists who pay the heaviest tribute. The commonest localization for the professional chancre is the hand, the index and middle fingers and the thumb being most often affected. The next most important localization is the conjunctiva. The true nature of the occupational chancre is often not recognized, as it assumes the appearance of a banal affection such as a whitlow or ordinary conjunctivitis. The difficulties in diagnosing occupational chancres are the same as in detecting other extragenital chancres; the true nature of which is often not recognized until the secondary stage. The prognosis is no worse than that of other syphilitic chancres. Prophylaxis is of the utmost importance and should be carried out by wearing gloves, careful disinfection of the hands, and protection of the eyes by spectacles during examination of the nose and throat.

Correspondence

An Oxygen Tent Service

SIR,—Rather over a year ago the British Red Cross Society deposited in each of the twelve teaching hospitals of London an oxygen tent of the Guy's Hospital pattern so that a wide experience of this method of treatment might be gained. We who were appointed as a small medical advisory committee would in the first place like to thank the society for their public spirited action, the value of which is indicated by the reports received from the various hospitals. All these reports emphasize the value of the oxygen tent in the treatment of grave cases of anoxaemia.

One of these reports that from St Bartholomew's by Dr Reavell, has already been published (*Lancet* 1936 2, 250) and we may quote his statement that from the clinical point of view the results were better than with any previous method of oxygen administration and patients were kept in the tent continuously for periods up to twelve days without any difficulty. A report from another hospital emphasized its value in the treatment of children suffering from bronchiolitis or bronchopneumonia: once in the oxygen tent these small children appear to resent being taken out [this point was also observed at another hospital] and there is no question that this apparatus is highly successful and almost the only method of achieving the results attempted. In another hospital a child who had had one lung removed by operation was in the tent for a considerable time and the treatment proved of the greatest benefit. Another report describes a girl aged 11 months whose colour improved and who appeared much happier within about half an hour of entering the tent; the pulse rate and the respiration rate fell and the child made a good recovery. Another patient aged 65 with chronic bronchitis and asthma strongly objected to the tent when it was first used for him but was later readmitted to hospital very cyanosed and dyspnoeic and almost moribund. This time he felt so much better in the tent that he willingly persisted with it and made a remarkable recovery after some four days. Later he did not remember ever having been in the tent at all. It is perhaps unnecessary to multiply instances of the beneficial effect of a treatment which merely ensures that the patient is getting a known high percentage of oxygen.

When the details of managing the patient are considered it is perhaps natural that there should be some difference of opinion. Dr Reavell stated that the tent could be set up and new people instructed in its management in two hours; when once running no undue call was made upon the house physician and apart from general supervision by the house physician it could be managed entirely by the ward clerks and nurses when once the sister and nurses had become accustomed to the tent it was little or no hindrance to general nursing. Another report says that the oxygen control presents no difficulty and a concentration of 50 per cent could easily be obtained and maintained. The gas analyses of which oxygen is the most important can easily be carried out and can soon be taught to sisters and nurses. In one hospital it was noted that the tent could be used satisfactorily for surgical cases but in another hospital the nursing of these cases in the tent was found to be extremely difficult. Several reports emphasized the difficulty of controlling delirious and fractious patients in the tent. This difficulty is common to all methods of oxygen administration.

Some criticisms of the details of the manufacture of the tent were expressed but this is perhaps not surprising, considering that it was the first time that this particular type of tent had been made up in quantity in this country and the firm employed had had no previous experience of this kind of work. The chief criticism is the flimsiness of the material so that a stronger and more substantial material is now being used in all the tents that are being made at present.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The following candidates have been approved at the examination indicated

DIPLOMA IN MEDICAL RADIOLOGY
A P Booth J Bouchard A B
C J C Cooke M W Dinab (dist
Evans T H T Gaitby Muriel O Gibson, D Gold W Irwin
J L King M Lederman C T MacCarthy M A M Marei
J R M Martin V Prakash H Pringle R R Rishi A Sirry
C P Theron D C Virmani J W Winchester

UNIVERSITY OF MANCHESTER

The Vice-Chancellor Professor J S B Stopford has been appointed as the representative of the University at the Coronation Ceremony on May 12

The following appointments have been made Dr P M Crowe as assistant lecturer in mental diseases Dr F A Gill as special lecturer in mental diseases Dr H B May as assistant lecturer in bacteriology and Dr C H Adderley as assistant bacteriologist in the routine section of the department of bacteriology and preventive medicine

UNIVERSITY OF SHEFFIELD

At the meeting of the University Council on February 12 it was announced that a further grant of £250 in aid of research in the department of pharmacology would be made by the Rockefeller Foundation of New York Dr M A MacConaill was appointed representative of the University on the Joint Committee of Anthropological Research and Teaching The Council accepted with regret the resignations of Mr G H Froggatt M R C S of the honorary lectureship in dental mechanics and Dr J Mathewson Webster of the honorary lectureship in forensic medicine and accorded them its thanks for their services to the University

UNIVERSITY OF DURHAM

The *London Gazette* of February 2 1937 contains an announcement giving notice that Statutes for the University of Durham under the University of Durham Act 1935 have been submitted to His Majesty in Council and that copies of these Statutes can be obtained at the Privy Council Office Whitehall S W

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A meeting of the Council was held on February 11 with the President Sir Cuthbert Wallace in the chair

A loyal address to His Majesty King George VI was approved

The following L C C hospitals were recognized under Sections 21 and 23 of the Fellowship Regulations Dulwich St Giles St Olaves Fulham St Leonard s Mile End St Alfege s St Andrew s St James Lambeth Lewisham St Mary Islington St Charles St Mary Abbots Bethnal Green Hackney Candidates who wish to qualify for admission to the Final Fellowship examination by holding a resident post at one of the above L C C hospitals are however required to produce evidence of the suitability of such post before accepting the appointment

Sir Charles Gordon Watson was appointed Bradshaw Lecturer and Sir Charles Sherrington Thomas Vicary Lecturer for 1937

It was announced that the Council election occasioned by the retirement in rotation of Sir Holburt Waring Mr C H Fagge and Mr W Sampson Handley would take place on Thursday July 1

Diplomas

Diplomas of Membership were granted to W J C Crisp and to the 178 candidates whose names were given in the report of the meeting of the Royal College of Physicians of London published in the *Journal* of February 6 at page 306 as were the names of the seven candidates who have been granted Diplomas in *Tropical Medicine and Hygiene*

Diplomas in Medical Radiology were granted jointly with the Royal College of Physicians to G G Binnie F Constant Mary J Cronin and J M Lees

Diplomas in Anaesthetics were granted jointly with the Royal College of Physicians under the special conditions of the regulations to H Richards R D Pramanik and to the nineteen candidates whose names were printed in the report of the meeting of the Royal College of Physicians of London in the *Journal* of February 6 at page 306

CONJOINT BOARD IN ENGLAND

The following hospitals have been added to the list of institutions recognized by the Examining Board in England during the year 1936

For the Diploma in Anaesthetics Kettering and District Hospital North Middlesex County Hospital West Middlesex County Hospital Oldchurch Hospital Romford County and City of Perth Royal Infirmary *Hospital for Sick Children Great Ormond Street London W C

For the Diploma in Child Health Belgrave Hospital for Children Clapham, S W Evelina Hospital for Sick Children Southwark S E Hospital for Sick Children Great Ormond Street W C Paddington Green Children s Hospital W Princess Elizabeth of York Hospital for Children Shadwell E Queen s Hospital for Children Hackney E Royal Waterloo Hospital for Children and Women S E South Eastern Hospital for Children Sydenham S E Victoria Hospital for Children Tite Street S W Alder Hey Hospital for Children Liverpool Booth Hall Hospital for Children Manchester Jenny Lind Hospital for Children Norwich St Mary s Hospital Portsmouth

For the Diploma in Laryngology and Otology East Suffolk and Ipswich Hospital Ipswich Radcliffe Infirmary Oxford Royal Hospital Wolverhampton Royal Infirmary Doncaster

For the Diploma in Ophthalmic Medicine and Surgery East Suffolk and Ipswich Hospital Ipswich Royal Infirmary Doncaster Sussex Eye Hospital Brighton

For the Diploma in Psychological Medicine Erdington House Birmingham

For the Diploma in Tropical Medicine and Hygiene Usher Institute Edinburgh

* Under special conditions

Medical Notes in Parliament

The report of the Committee of the Privy Council for Medical Research and Report of the Medical Research Council for 1935–6 was presented to both Houses of Parliament on February 11 On the same day a scheme for increasing the demand for milk by publicity and propaganda within the area of the Milk Marketing Board for England and Wales was laid on the Table in both Houses

The Factories Bill was read a second time by the House of Commons on February 15 without a division and was sent to a Standing Committee Sir Ernest Graham Little has been added to this committee

The Consolidated Fund (No 1) Bill and the Unemployment Assistance (Temporary Provisions) (Amendment) Bill were read the third time and passed in the House of Lords on February 16 On the same day the Lords passed the Regency Bill and the Architects Registration Bill through committee

The Registration and Regulation of Osteopaths Bill was down for second reading in the House of Commons on February 12 but was not reached

In the House of Commons on February 16 Sir Kingsley Wood introduced the Local Government (Finance Provisions) Bill, which amends Part VI of the Local Government Act, 1929, and repeals Section 45 of the Unemployment Assistance Act 1934 and the proviso to paragraph (c) of subsection 2 of Section 9 of the Rating and Valuation Act 1925

The Maternity Services (Scotland) Bill was reported to the House of Commons from Standing Committee with amendments on February 16

Mr Chamberlain on February 17 moved a resolution to authorize the borrowing during the next five years of sums up to £400 000 000 for defence expenditure

New proposals were published in a White Paper on February 17 for revising the block grant to local authorities in England and Wales These proposals (with which the local authorities agree) are the result of investigation into the working of the formula whereby £44,000 000

The Red Cross Society offered the tent to the hospitals for purchase at a little under half their original cost and seven of the hospitals accepted this offer It may perhaps cause surprise that this offer was not accepted by five of the hospitals, but in four cases the refusals are thought to be due to certain technical imperfections in the tent, or to a preference for a tent of another type or some simpler method In the remaining hospital the patients who had been ill enough to require this treatment were so few that it was felt that for the time being a tent could be hired when desired, and that an improved model might be forthcoming later

A final word may be said about the action taken by the London County Council, which controls a very large number of beds For about a year now they have had twelve tents in operation, and are hoping to increase the number so that each general hospital and each fever hospital will have at least one tent

In our previous letter we stated that arrangements had been made by one of us to send a tent to any part of the country at the request of any medical man, and that a physicist, not medically qualified, would accompany the tent The demands on this "Oxygen Tent Service" have steadily increased during the year, so that it has now been possible for it to launch out on its own account as an independent concern Applications should now be made to T W Adams, A Inst P, "Oxygen Tent Service," 33, Devonshire Street, W 1 (telephone number Welbeck 2003, and at night Gerrards Cross 1163) This service, which supplies British-made tents, together with the two other services in London, which supply American tents, should be sufficient to meet all the demands for this particular type of treatment at the present time—We are, etc,

London, W, Feb 12

Specific Antitoxins for Gonococcal and Meningococcal Infections

SIR,—The careful and critical observations recorded by Dr T Anwyl-Davies in the *Journal* of February 13 (p 321) on the treatment of cases of gonorrhœa during the past three years with antitoxic serum leave little room for doubt that we are witnessing the first stage of a definite practical advance, long overdue, in the specific therapy of gonococcal infection I feel sure that Dr Mellanby will agree with me that the credit for this important achievement is due primarily to Dr Anwyl-Davies himself, to Messrs Parke Davis, whose London representative, Dr Stanley White, has co-operated with him whole-heartedly in the work, and to Dr Ferry, who has prepared the serum by the method that he himself devised for the preparation of similar antitoxic serum for cases infected by that closely related organism the meningococcus

But with your permission, Sir, I would like to point out that in your editorial comments on this paper there is an oversight The starting-point of this valuable work on the gonococcus was not the studies of Corbus and his colleagues in America, but, as Dr Anwyl-Davies generously and specifically states at the beginning of his paper, the striking success obtained in this country during the war in the treatment of military cases of cerebro-spinal fever with serum definitely capable of neutralizing the intracellular toxin of the meningococcus The manner in which this close association between the anti-endotoxic capacity of the serum and its therapeutic potency came to notice was as follows

Although large supplies of anti-meningococcus serum were available and its use in military cases compulsory, the mortality among troops in training in this country during the winter of 1914-15 who contracted cerebro-spinal fever was approximately 50 per cent, and many able clinicians considered the serum valueless When the disease recrudesced during the following winter (1915-16) while the death rate in cases among the general military population remained at 50 per cent, the late Martin Flack and his clinical colleagues in the London district by employing a particular batch of serum succeeded in reducing the mortality to 18·5 per cent Comparison of this clinically potent serum with other batches of serum that had proved inert when given clinically showed that the former alone was capable of neutralizing the endotoxins of the two most prevalent types of the meningococcus The other antibodies paraded then and now in orthodox text-books—agglutinin, opsonin complement-fixing antibodies and lysin—were apparently useless, as several of the 'dud' sera contained them in full abundance At this point the batch of clinically potent serum ran out and the mortality in the London district began to mount' Clinicians were in despair because in contrast with their previous experience the serum supplied had no effect The secret of the potency of the good serum, however, had come to light Twenty batches of serum were in store, and it was found that while eighteen of them were inert two possessed definitely anti-endotoxic capacity Some of this antitoxic serum was at once sent to the special hospital for treating military cases of cerebro-spinal fever in the London district, with the result that their patients forthwith began to improve and the mortality for the season fell to 15 per cent

As it was found that the makers of these batches of antitoxic serum had meantime supplied batches devoid of that property it was clear that if the best therapeutic results were to be secured the preparation and standardization of the serum must be undertaken at the Central Laboratory The War Office and the Medical Research Council gave every possible help, and Dr Stanley Griffith of the Cambridge Field Laboratories undertook the preparation of the serum The Army Veterinary Department provided excellent horses and fodder Monotypical sera were prepared, and no serum was sent for trial clinically unless it had been proved at the Central Laboratory to contain anti-endotoxin for the particular meningococcus type concerned A pooled serum was put up for use in cases before the type of coccus at work had been determined The results exceeded all expectations The gross mortality among troops contracting cerebro-spinal fever fell to 35 per cent when the case mortality from the same disease among men of a similar age group in the civilian community remained at 58 to 60 per cent as in previous years The chief success, however, was in cases infected by Type I the chief epidemic strain of the meningococcus then and since and apparently the most fatal one Out of sixty-five cases due to Type I, of which forty-eight were regarded by experienced clinicians as fulminating, severe or very severe, no fewer than fifty-nine recovered The serum, moreover, was clearly antitoxic in its action, for the clinicians frequently observed striking and definite improvement in the condition of the patients within half an hour of its administration

In view of this experience, which has since been confirmed by similar experience when testing specimens of serum for use at Aldershot during the meningitis outbreak of 1931, I have no doubt at all that in case of meningococcus infection the chief antibody requisite for clinical potency is anti-endotoxin Owing to the close similarity between gonococcus and meningococcus it seemed more than likely that cases infected by the former would also respond to treatment by antitoxic serum in the same way Dr Anwyl-Davies has now shown that this is the case

With some of the other remarks in your annotation, § I am in the fullest agreement

has been distributed every year from the exchequer to help provide health and other local services This assistance will now be increased by some £5,000,000 a year to £49,000,000 in grant or £46 000,000 in cash payments A larger proportion than hitherto will benefit the poorer areas by giving greater weight to the amount of local unemployment and also to sparse population The necessary Bill has been introduced

A petition "from inhabitants of the United Kingdom" for prohibition of experiments on dogs has been presented in the House of Commons

Grounds for Divorce

A Standing Committee of the House of Commons resumed on February 2 consideration of the Marriage Bill introduced by Mr De la Bere

RECURRENT FITS OF INSANITY OR EPILEPSY

On Clause 5 (New Grounds for Nullity) Mr SPENS moved to leave out as a ground for nullity that a person was 'in a state of mental unsoundness which has become definite within six months of the marriage, or was at the time of the marriage, subject to recurrent fits of insanity or epilepsy' Mr Spens said he could not perceive what the expression "recurrent fits of insanity" was intended to achieve The phrase appeared to be covered by other provisions of the Bill It was a new suggestion that recurrent fits of epilepsy should be a ground for annulling any contract, and would introduce a new principle into the law Epilepsy often developed into some form of mental deficiency or insanity, in which case it would be covered by the other provisions

Sir ARNOLD WILSON said these provisions were recommended in 1912 by both the majority and minority of the Royal Commission on the Marriage Laws which sat immediately after the detailed inquiry into mental deficiency from 1905 to 1908 The committee reached the unanimous conclusion that recurrent fits of insanity or epilepsy should constitute a ground for nullity, and that conclusion has never been challenged in the controversial literature since issued The difference between lunacy and recurrent fits of insanity was partly legal There were times in certain cases when a person of unsound mind was sane and judged to be capable of fulfilling a contract Questions of eugenics should be in the minds of the committee, but he preferred to take the point that the marriage contract would not have been undertaken had the other party known of those recurrent fits As regards epilepsy, it was normally hereditary and the consequences were disastrous The epileptic parent was a terror to children and to the other parent and although the Bill did not seek to upset the contract if it was undertaken with full knowledge that the other party was epileptic he wished to give effect to the ordinary law of contract where there had been concealment or fraud There had been no progress by medical science in dealing with epilepsy It had to be recognized as a malady for which there was no certain cure, and for which isolation was the only remedy The Mental Deficiency Committee reached the unanimous conclusion that epileptics in general should be segregated, and that people subject to recurrent fits of epilepsy or insanity should be cared for at the expense of the State in colonies of various types but not regarded as fit members of society

The amendment was by leave withdrawn

Sir ARNOLD WILSON moved an amendment dealing with the same passage as that on which Mr Spens had spoken He proposed to substitute the words 'was at the time of the marriage or has been within twelve months of that time, placed in an institution or guardianship under Section 3, Section 6 Section 8 or Section 9 of the Mental Deficiency Act 1913' Sir Arnold summarized the relevant sections of the Mental Deficiency Act and said there was full provision in them for medical examination by two doctors and medical certificate Section 8 related to mental defectives who had been found upon medical inquiry at the instance of justices to be medically defective, and were certified as such Section 9 referred to persons who had been placed in a lunatic asylum, criminal or other, but were thereafter certified by doctors not to be insane but to be mentally defective The new words he proposed did not differ in general scope from the original ones, which referred to mental unsoundness that had become definite within six months of marriage His amendment would prevent any persons being made the subject of a petition for nullity on this ground unless they had appeared before the court with full medical evidence and had opportunity of having their own doctors

The committee then agreed to the amendment

VENEREAL DISEASE

Commander BOWER moved to leave out the paragraph establishing as a ground for nullity that the respondent was at the time of the marriage suffering from a venereal disease in a communicable form" Commander Bower said medical opinion was divided on whether venereal disease was curable or not Great strides had been made in recent years in curing it, particularly in cases of hereditary venereal disease of the third or fourth generation The paragraph under discussion proposed to allow a breach of the marriage tie on account of a possibly curable bodily state Venereal disease was often contracted innocently Why, then, put in venereal disease and not diabetes?

Sir ARNOLD WILSON said the promoters of the Bill intended at a later stage to define more closely venereal disease, which had not yet been defined in any statute They were at work to produce a definition that would restrict it to those forms of disease unquestionably perilous to the offspring as well as to the other spouse, and were probably incurable so far as recurrent possibilities of infection presented themselves He thought it would be possible to exclude forms of venereal disease innocently contracted—cases generally ascertainable, and, if properly treated, not transmissible

Commander BOWER withdrew his amendment and the committee agreed to delete the words "in a communicable form" on Sir Arnold Wilson's undertaking to produce a definition of venereal disease

The amendment was agreed to

The other grounds for nullity were not challenged, and Clause 5 was approved as amended

Clause 7, "Abolition of decree nisi' and Clause 8 "Further provision for custody, etc, of children, were struck out of the Bill, and the committee adjourned

On February 9 Sir ARNOLD WILSON moved a new insanity definition clause, which enacts that a person of unsound mind shall be deemed to be under care and treatment (*a*) while he is detained in pursuance of any order or inquisition under the Lunacy and Mental Treatment Acts, or of any order or warrant under the Army Act the Air Force Act, the Naval Discipline Act, the Naval Enlistment Act, or the Yarmouth Hospital Act, or was being detained as a criminal lunatic or in pursuance of an order made under the Criminal Lunatics Act, 1884, and (*b*) while he is receiving treatment as a voluntary patient under the Mental Treatment Act, 1930 being treatment which follows, without any interval a period of such detention as stated above, and not otherwise The new clause was added to the Bill

This concluded the committee stage, and the Bill was ordered to be reported to the House

Maternity Services in Scotland

The Standing Committee on Scottish Bills began on February 4 the consideration of the Maternity Services (Scotland) Bill

On Clause 1 (Provision of Maternity Services) Mr PETHWICK-LAWRENCE moved to include among the facilities which should be available when required by the Department of Health "The services of an anæsthetist when recommended by the medical practitioner Mr Elliot agreed to this amendment

In Clause 1, Subsection 5 Mr LEONARD moved to omit the provision for consultation between the local authority preparing a scheme and 'such local organization (if any) of

The anti meningococcus serum referred to above was standardized by collecting strains of the meningococcus as soon as possible after isolation from cerebro spinal fluid Their pathogenicity for mice by intraperitoneal injection was then compared and the most toxic selected Several hundred plate cultures were made from the most active strains and after incubation overnight at 37 C the growth of each was scraped off in a minimum amount of saline examined microscopically and then pooled The bodies of the meningococci were then concentrated by centrifuge, the supernatant fluid discarded and the deposit dried in Petri dishes in a vacuum desiccator overnight at 37 C Next morning the brown flakes of the dried meningococci were scraped off and powdered Approximately 2 mg of this powder was found to be fatal to mice on intraperitoneal injection For testing a number of specimens of serum an extract was made by grinding up the dried and powdered bodies of the meningococci in distilled water to which N/40 NaOH had been added in order to dissolve the powder Two milligrammes of the powder or 0 1 to 0.2 c cm of the solution of the bodies were next put out into a number of watch glasses 0 5 c cm of normal serum was added to each of the first pair and a similar amount of each of the serum specimens for test to remaining pairs of watch glasses containing the endotoxin The watch glasses were incubated at 37 C for half an hour to allow the serum to neutralize the toxin and then the contents of each were injected intraperitoneally into a mouse The next morning the control pair of mice were moribund or dead and the same thing happened to the remaining mice unless the serum contained anti endotoxin in which case the mice appeared to be unaffected Many hundred specimens of serum were tested in this way and although most batches of serum were rejected the clinical results obtained with serum standardized in this way proved the soundness of the method Further details are given in the official *Medical History of the War* and in Report No 50 of the Medical Research Council

I agree with you, Sir that it is far more likely that this toxin obtained by Ferry by filtering young cultures of either meningococcus or gonococcus is an endotoxin than that it is an exotoxin Unlike true exotoxins such as those of diphtheria and tetanus the endotoxin of the meningococcus is remarkably thermostable and even stands boiling for thirty minutes as pointed out in the Medical Research Council report referred to Both meningococcus and gonococcus autolyse very rapidly so that in fluid cultures one would expect that their intracellular toxin must be quickly liberated

Finally I would add that it seems to me to be a great pity that in this country we have no State Serum Institute where problems of this kind of great practical importance to the community can be continuously investigated Advances in specific serum therapy are too urgently wanted to be left to the initiative of individual firms, however enterprising and progressive But if it is to prove a success such an institute must be in close touch with both laboratory workers and actual cases For that reason it is worth considering whether the institute should not form part of a hospital or group of hospitals It should certainly not be isolated or little practical progress can be expected A farm would be required where the horses could be kept, and care should be taken to see that the main object should be not the routine testing of serum specimens but the advancement of knowledge by experiment so that clinical improvement can be obtained in cases where the infecting organism is known but specific therapy is at present either ineffective or unavailable Unlike meningococcal meningitis which is comparatively rare, gonococcal infection is so constant and ubiquitous and the injury caused by it so widespread, that the public importance of improvement in its specific therapy can hardly be overestimated—I am etc,

St Bartholomew s Hospital Feb 14 M H GORDON

SIR—The extremely interesting paper by Dr T Anwyl Davies in your issue of February 13 may well prove to be a landmark in the long history of gonorrhoea if his clinical results are in due course confirmed Your annotator refrains from discussing these results but directs some criticism at the theory that the serum with which they have been produced is an antitoxin I am aware that pathologists in this country have not been able to confirm fully Ferry s work on the production of exotoxin from the meningococcus and the corresponding antitoxin I am not qualified to discuss the pathological aspect, but in view of Dr Anwyl Davies s striking clinical results with the so called gonococcus antitoxin it may be opportune to state briefly my own experience to date with the corresponding meningococcus antitoxin in cerebro spinal fever Elsewhere I have given some account of this (*Lancet* 1935 **1**, 856) I can now summarize the results of cases treated during the last three years (1934–6) In order to evaluate the effect of this treatment in the acute stage I must exclude the following

(*a*) Three cases recovering on admission (*b*) one case dying within six hours of admission (*c*) four cases admitted late in the chronic stage with permanent paralysis (three were infants in the stage of post basic meningitis) (*d*) three successive cases treated with a batch of serum which had been faultily stored for over six months in summer and which was according to its agglutination reactions inert (*e*) one case proved at necropsy to have died from cisternal haemorrhage the meningitis having cleared up (*f*) one case fatal from pneumococcal meningitis some weeks after recovery from the meningococcal meningitis

There remain twenty five patients of whom twenty four recovered Even the one fatal case recovered from the primary attack—it was a relapse that was fatal Not a single case failed to respond and respond rapidly in the primary acute stage none of them entered the chronic stage There was only one relapse The only complications were two cases with transitory paresis and one with permanent deafness A large proportion of the cases were very acute all memory of events being blotted out for several days All cases were bacteriologically verified and all but three were typed—namely Group I (fifteen) Group II (five) agglutinable (two) The age grouping was 0 to 1 (*nil*) 1 to 4 (four) 2 to 5 (five), 5 to 20 (eight), 20 to 40 (eight)

It should be added that the treatment was *intensive* during four to six days from admission and in all cases included one large intravenous dose It may be considered that the intensiveness of the treatment was the predominant factor but with one exception I have never had such consistent results with other sera even when used similarly The exception was the Type I serum containing anti endotoxin prepared by Gordon (1918–19) which I had the privilege of using in a few cases in the year 1919 It is difficult to escape from the conclusion that whatever the nature of the antibodies contained in Ferry s serum it is capable of exerting a highly specific effect—I am etc,

H STANLEY BANKS
Medical Superintendent Park Hospital

London S E 13 Feb 15

SIR—Dr Anwyl Davies s interesting paper in the *Journal* of February 13 on the specific antitoxin treatment of gonorrhoea gives rise to certain pertinent questions regarding the clinical technique used No mention is made of the orthodox treatment (irrigations prostatic and vesicular massage etc) and it is of the utmost importance to know whether Dr Anwyl Davies s patients received orthodox treatment concurrently with antitoxin

registered medical practitioners as appears to the authority effectively to represent the opinions of such practitioners practising in their area He proposed to substitute medical registered practitioners practising in their area who in the opinion of the Department are specially qualified in midwifery He said many doctors in large towns were not keen on this work In Glasgow in 1935 an analysis of notifications of births indicating an attendance in the homes was made and revealed that a small number of medical practitioners in Glasgow undertook this work A local authority should have a panel of doctors specially qualified in this work and efforts should be made to consult with the groups of medical practitioners specially qualified to give guidance on it

Mr ELLIOT said this was a far reaching proposal Trade union representatives would be indignant if the Department of Health for Scotland made itself the judge whom it should consult in an organized trade That the Department should be empowered to go over the head of the organization which those interested had set up and select the people it wished to consult on conditions of employment would be a delicate business and a dangerous precedent What was to be the test of this special qualification? Merely the opinion of the Department

Mr Leonard withdrew his amendment

TEACHING OF MIDWIFERY

Mr ELLIOT begged to move in the same clause the proviso that

> The Department before the concluding proposals under this section shall satisfy themselves that as far as reasonably practicable the proposals make provision for co operation between the local authority and recognized medical schools and institutions or other organizations engaged in the training of midwives and for reasonable facilities for the teaching of midwifery

He said that the amendment enjoined co operation upon those concerned It might be that the services would be developed in future along lines which could not be exactly foreseen therefore the words should provide in most general terms for the purposes which all desired The amendment left it possible for the administrative services of the medical schools and of great hospitals and institutions to make in future years a service of more advanced type than could be conceived to day

Mr GRAHAM KERR said his friends were grateful for the step which had been taken but were not satisfied that it was long enough The clause seemed too vague On receiving an assurance from the chairman that the new clause which he had tabled would be considered later Mr Graham Kerr said he would accept the amendment and the committee agreed to it

MATERNITY BENEFIT AND PATIENTS' FEES

On Clause 2 (Fees for Services Provided) Sir ARCHIBALD SINCLAIR moved to omit Subsection 2 which secures that maternity benefit under the National Health Insurance Act 1936, should to the extent that the woman authorized be paid to the local authority toward the fees for which the woman would be liable under the Bill for services provided by the local authority Mr ELLIOT pointed out that the subsection was purely an enabling one but he recognized that there seemed a general desire for its deletion The committee then agreed to Sir Archibald Sinclair's amendment and Clause 2 as amended was added to the Bill Clause 3 passed unamended

On the question that Clause 4 stand part of the Bill Mr PETHICK LAWRENCE remarked that in some parts of the Bill the lying in period was referred to without specifying any particular time but that Clause 4 used the words ten days immediately after childbirth He suggested that before the report stage Mr Elliot should substitute the words the lying in period and not limit it to any particular number of days Mr ELLIOT said the reference to ten days in Clause 4 was because the rules of the Central Midwives Board for Scotland rightly prescribed that midwives should be responsible for cleanliness and give all necessary directions for securing the comfort and proper dieting of the mother and child during the lying in period, which should be held, for the purpose of those rules and in a normal case to mean the time occupied by the labour and a period of ten days thereafter If the committee desired ten days might be altered to fourteen but not to a general term such as lying in period because this was a matter on which a prosecution might take place and it was therefore desirable that it should be referred to in days There was no specific consultation on this point with the organization of midwives

The committee agreed that the clause should stand part of the Bill and adjourned

Consideration of the Bill was resumed on February 11

On Clause 6 (Prohibition of Unqualified Person Acting as Maternity Nurses for Gain) Major NEVEN SPENCE moved to extend the prohibition to persons attending the lying in whereas the Bill limited the prohibition to those receiving any remuneration for attending He said the clause opened the way to a whole host of busybodies taking part in nursing maternity patients The greatest danger to which a woman could be exposed was to allow any person who did not understand antiseptic methods to come near her Mr T M COOPER said that the clause should be read along with the existing provisions contained in the Midwives and Maternity Homes (Scotland) Act 1927 Section 1 which penalized any person not being a qualified person who attended a woman in childbirth otherwise than under the direction and personal supervision of a duly qualified medical practitioner The person against whom Clause 6 of the Bill was directed was the woman who carried on the trade of a handywoman attending women in childbirth or during the period immediately thereafter

Major NEVEN SPENCE withdrew his amendment and said the case which he had put must occupy attention in the future if further progress was to be made

On the motion of Mr PETHICK LAWRENCE four een days was substituted for ten days as the lying in period if it should be increased to the larger term by the Central Midwives Board Mr COOPER said he would examine the Bill to see at what other places a similar alteration might be necessary

ATTENDANCE IN MENTAL HOSPITALS

Mr JAMES BROWN moved to leave out the exemption applying to mental hospitals and said he had yet to learn that there was any large training in midwifery in asylums Mr COOPER said asylums and mental deficiency institutions were under a separate code of control under the supervision of the General Board of Control This was a complete and skilled control and full medical supervision and assistance was made available when confinements took place in these institutions It seemed to the Government that the proper method of approach was to use the existing administration and control applicable to asylums and mental deficiency institutions and not apply the drastic course of imposing penalties upon salaried officials of those institutions who might under supervision render service as nurses to a woman after confinement He was willing to satisfy the House on the report stage that the existing control on the medical side of these institutions was ample to secure full protection for those who underwent confinement

The amendment was withdrawn

Mr COOPER moved a drafting amendment to enable the operation of the Bill to be postponed until May 16 1937 so as to get the benefit of the new awaited formula under the block grant The committee agreed to the amendment and the clause as amended was added to the Bill

QUALIFICATIONS OF MEDICAL SUPERVISORS

On Clause 8 (Miscellaneous Amendments of Midwives (Scotland) Act 1915) Major NEVEN SPENCE moved to add in the subsection dealing with the appointment of supervisors the words such qualifications shall include practical experience in midwifery and maternity nursing subsequent to training He said it was essential that anybody who was to supervise midwives in their work ought to have thorough practical experience Mr GRAHAM KERR seconded the amendment

If this was the case it is equally important to know (as a matter of control) the effect of orthodox treatment alone under the same conditions That this is of supreme importance in evaluating any new treatment of gonorrhoea is made evident by some of the results annotated (p 335) For instance, Dr Anwyl-Davies's figures of two clinical cures in sixteen days of cases of uncomplicated gonorrhoea out of thirty-six cases is in my opinion, taking into consideration the ideal conditions under which the treatment was applied, nothing startling nor are four (about 10 per cent) cures in three weeks any more so One knows that the problem of gonorrhoea would almost cease to exist with the universal hospitalization of all acute and uncomplicated gonorrhoea cases treated under research conditions by experts With regard to epididymitis, to say that patients discharge themselves from hospital in five or six days because "they felt so well" is, in my submission, no advance on the results obtained by purely orthodox methods—that is, local (non-specific) symptomatic treatment in otherwise similar surroundings

Gonorrhoea is notorious for its innumerable methods of treatment (as in all incurable or "difficult" diseases), and no hell is paved with better intentions than the cure of gonorrhoea It is for these reasons that results of any new gonorrhoeal therapy must be rigidly controlled, contrasted, and correlated with results obtained by the orthodox methods Nothing less will satisfy those who, while retaining their enthusiasm, have learned from painful experience to temper it with caution—I am, etc,

Enfield, Feb 13 W LESTER

Cancer of the Breast

SIR,—Who was the first to do so-and-so and who was the first to put pen to paper on the subject are not always the same people Many minds reach the same stage of thought about the same time Mr Keynes (*Journal*, January 30, p 242) has gained his reputation with regard to radium in the treatment of carcinoma of the breast as being the first to conduct a series of experiments on a really systematic basis, and this in the face of the Paris pronouncement that radium held no place in the treatment of carcinoma of the breast What Paris said in those days no one gainsaid—they led the world

It was only by trial-and-error methods that this treatment was established in this country, and many of us thought in those days very differently from what we think now I remember Mr Sampson Handley's recommendations They were well and conscientiously tried both with regard to the glands in the anterior mediastinum and the spread in the subcutaneous tissues A diagram illustrating his views appears in *Radium and Cancer* (1930) His recommendations, like many others of those days, had, I thought, completely disappeared I am surprised to see he still uses radium for the intrathoracic spread The real cause for the diminution (not abolition) of the local recurrence is earlier diagnosis rather than the nature of the modern operation If Mr Sampson Handley will forgive me for saying so, we have all enjoyed better results during the last fifteen years, and this can hardly be due to details of operating or placing of radium as he thinks The only denominator common to us all is earlier diagnosis An axiom I hope accepted by all workers now is that radium is practically useless in inaccessible cancer glands that can neither be seen nor felt are certainly inaccessible, we cannot even be sure of their existence in all cases

I hope the feeling is growing among those interested in breast surgery that wide infection of the glands in the axilla and the likelihood of intrathoracic spread render the case inoperable, this I have taught for years If the circulatory spread of the disease was more widely recognized more cases would be considered inoperable, but the modern pathologist has never had the vogue which Mr Sampson Handley enjoyed

No procedure for dealing with carcinoma of the breast is free "from a trying period of uncertainty" whether the treatment is by operation or radium, or by both Early recurrence after radium treatment alone must depend on how the radium is used My experience is that it is rare, and this is, I believe, the opinion of my colleagues at Mount Vernon Hospital My views as to the modern treatment of carcinoma of the breast are that in really early cases (without signs or symptoms and only a shadow by transillumination) local operation and radium is sufficient In the ordinary case radium alone or operation and radium is the best treatment, operation alone has quite fallen from my use Anything beyond the ordinary case I consider as inoperable and treat with radium alone

I heartily endorse Dr Gilbert Scott's remark (February 6, p 297) "Too much stress is laid upon the possibility of 'cure' and too little upon relief of symptoms and prolongation of useful life" It is the individual and not the disease that we treat—I am, etc,

London, W 1, Feb 9 DUNCAN C L FITZWILLIAMS

SIR—May I as a former colleague of Mr Cecil Rowntree add my appreciation of his excellent and impartial treatise on the above subject (*Journal*, January 23, p 153) It is at least an answer to those who are inclined to decry x-ray therapy and use the radiologist merely as a scapegoat I cannot, however, share his optimism regarding higher-voltage x rays, though until we know more about the chemical, and more especially the physical, characteristics of the cancer cell we can only surmise their effect

Dr Webster is right, I think, when he states that effect is proportional to the quantity, or energy, absorbed, and it seems logical to assume that this will be less when more penetrating rays are employed Reasoning upon these lines, it follows that there must also be an optimum wave length, I firmly believe that the future of x ray treatment lies in contact therapy At present we are compelled to work at too great distances, with too large ports of entry, and with excessive filtration It seems to me that the sole virtue of radium lies in our ability to place it in contact, or nearly so, with the growth The ideal to aim at should be what for lack of a better term I will call adequate "ray density" per square centimetre of tissue Under present methods too many cells escape efficient irradiation Without enlarging further I predict that when contact therapy at 130 kV is possible our results will be equal and probably superior to those obtained with radium Here is a golden opportunity for the British manufacturer —I am, etc,

Colwyn Bay, Feb 15 W GRIFFITHS

Sclerosing Submucosal Injection of Turbinates

SIR—In his letter in the *Journal* of February 13 (p 350) Sir Robert Woods, whose opinion always demands respect, says that the puncture method of using the cautery for reduction of the turbinates came into vogue twenty five years ago, but was found dangerous For the last twenty five years I have regularly used it, and have never found it harmful Quite the reverse, in fact and this is possibly because I have taken care how and when I did it never

Mr COOPER accepted the amendment subject to omission of the words 'and maternity nursing' He said he was advised that in some parts of Scotland it would not be practicable to obtain supervisory medical men with practical experience in maternity nursing subsequent to their training

With the proposed alteration the amendment was inserted in the clause Major NEVILL-SPENCE then questioned the meaning of subsequent words in the clause, and Mr COOPER explained that the whole subsection would enable the Department to prescribe the qualifications to which applicants for the position of supervisors would be required to conform, but there were sparsely populated districts in the Highlands where it was not possible to get persons in a position fully to comply with the general requirements Elasticity was therefore essential, but relaxation of the general qualifications would be as sparing and infrequent as possible On this explanation the clause as amended was ordered to stand part of the Bill

A new clause dealing with facilities for instruction in midwifery and running as follows

> "In every area where there is a recognized medical school the local authority of that area and the Department of Health shall take steps to secure that adequate facilities are made available for the practical domiciliary instruction in midwifery of any person undergoing training with a view to becoming a duly qualified medical practitioner or a certified midwife"

was brought up and moved a second time by Mr GRAHAM KERR He said this new clause was pressed by four universities, three maternity hospitals, and the extramural medical schools of Scotland He said that in civilized communities the operation of childbirth was apt to be interfered with by disturbing factors, which would often be detected only by the trained medical man, who perceived abnormalities by the heart, or the nervous system, or the internal organs of the body These considerations showed the importance of the Scottish procedure of having a medical man in control during both the ante natal and post-natal periods The need for the new clause arose from the fact that the universities and other bodies believed the safeguards which they had provided so far were not sufficient The training which a student underwent before he was 'turned loose' on maternity cases was thorough and carefully defined by experts He had to go through a training in obstetrics in a medical school, then went to a maternity hospital and got a specialist training there, and then began domiciliary work, at first under the supervision of someone from the hospital The training authorities wished to maintain that system, but also to do more The General Medical Council put it to universities and schools that present facilities must be improved and not merely maintained That was why he moved the new clause, which had definite expressions instead of vague expressions

The discussion was adjourned until February 16

Physical Training of the Nation

In the House of Commons on February 8 Mr OLIVER STANLEY moved a supplementary estimate for education services in England, Wales, and Scotland He said he was asking for an excess amount of £96 000 on elementary education There was an increase, among other things, in the special services—the school medical service nursery schools, clinics, and the feeding of children Dealing with the Government's new plans for physical training he said that the supplementary estimate would only enable them to carry on till the end of March Legislation would be necessary for the new scheme which had had a most encouraging response from the general public The scheme was designed to deal with physical training and recreation it was not and never had been meant to be a plan to deal with nutrition Physical training and nutrition were complementary not exclusive No one would regard physical training and recreation as a substitute for good nourishment but to give the impression that the great mass of our people were so underfed and so weak from lack of nutrition that they were unable to derive enjoyment or profit from physical training in games was a grotesque mistake He believed that the scheme of physical training might be of assistance to nutrition and that in working out the scheme they would gain a great deal more knowledge on this complementary problem Mr Stanley then explained the scheme in detail, and announced that Lord Aberdare had consented to become president of the advisory council

Sir FRANCIS FREMANTLE said it was true that to get the best use out of physical exercises there should be proper nutrition and medical and dental attention at school It did not follow, however, that they should wait until they had perfection before they made any advance with physical training The medical profession as a whole would be out to help the Government in its scheme It was essential that there should be a considerable change in medical education, which in the past had been the training of doctors in hospital to treat those who were sick Students had not been properly taught this ideal of producing healthy bodies

Sir ERNEST GRAHAM-LITTLE asked what methods were going to be adopted to see that positive harm was not done by the physical training of persons who were under nourished He said that the voluntary associations which were being entrusted with so much of the work under the Government's scheme were completely unequipped to undertake medical service

Mr ELLIOT, in replying to various questions, said that the supply of suitable clothes for physical training was a matter for the advisory council and the local committees It would be very advisable that grants should be made for that where associations were unable to meet the need themselves A Scottish organization would be set up under the scheme, which would be completely self governing There would be five regional committees for the whole country Four of these would be grouped round university centres, which would permit of close association with the medical schools and other such organizations

The House approved the Supplementary Estimate

Instruction of Doctors in Anti gas Treatment

Mr GEOFFREY LLOYD told Mr Duncan Sandys on February 9 that up to the end of January rather over 1,500 medical practitioners had completed courses of anti gas training given by the ten Home Office medical instructors originally appointed Six additional medical instructors were now at work The aim was to give this training to all medical practitioners in the country willing to receive it, and there should be no need to allocate individual doctors to particular districts Lists were available from which it would be possible at any time to notify to local authorities the names of those who had been trained in their respective areas

Mr SANDYS asked at what rate these practitioners were being trained, and whether all practitioners had been notified personally of the existence of the course Mr LLOYD said that practitioners had not been notified at present, though arrangements were available locally for the purpose Doctors were being trained at the rate of 2,000 a month

Poison Gas · Protective Measures Criticized

The House of Commons, on February 9 considered in committee of supply a supplementary vote not exceeding £153,000 for expenditure on public buildings Mr PRITT moved to reduce the vote by £100, and called attention to the expenditure on the Home Office civilian anti gas schools He urged that the expenditure of more money on these buildings was a criminal waste of public money because the policy behind it was wrong He said that the Government proposed to teach people at Easingwold that, first, they should have gas-proof rooms and use them, and, secondly, that gas masks should be a second line of defence in the event of the gas proof rooms being broken up, or if the people happened to be out and unable to get into the gas proof rooms when trouble began He wished to demonstrate on scientific grounds, that this policy was really little better than a sham

Mr HUDSON said that the reason the Government was asking for the increase was that instead of thirty students being accommodated as at first intended, it was now proposed at the request of the Home Office, to provide accommodation for sixty at Eastwood Park

Mr PRITT said it had been calculated that something like 8,000,000 people in the country were housed too badly for

BRITISH MEDICAL JOURNAL
LONDON
SATURDAY, JANUARY 2 1937

THE NEW TYPE

By an agreeable coincidence the *British Medical Journal* appears in a wholly new dress exactly eighty years after it assumed that name When the Provincial Medical and Surgical Association was founded in July, 1832, it had no weekly or fortnightly periodical to report its proceedings and represent its interests Like other medical societies of the day it published an annual volume of *Transactions* which appeared between 1833 and 1853, the last eleven volumes were overlapped by those of the *Provincial Medical and Surgical Journal* a weekly publication of which the first number appeared on October 3rd, 1840 The title of that paper—our direct ancestor—was changed in January, 1853, to the *Association Medical Journal* and four years later on January 3rd, 1857 the organ of the renamed British Medical Association took the title *British Medical Journal* "With a more comprehensive name" said the Editor, "we hope to be able to present to the Association a journal more comprehensive than it has hitherto been possible to furnish"

For many months past special committees of the Association have had under consideration a thoroughgoing reform of the typography and lay-out of the *British Medical Journal*, and they were fortunate in enlisting the services of Mr Stanley Morison, who had been largely responsible for the complete change of type face undertaken by the *Times* in the latter part of 1932 The main purpose of the change now made under Mr Morison's advice is to help the reader and the reader's eyes The type used to day for the whole of the letterpress of the *British Medical Journal* and its title page and table of contents was the product of some years of experiment in Printing House Square and it had been subjected to severe tests before adoption by the *Times* It is a clear plain print especially designed for easy reading when set up in columns and produced under newspaper conditions The designers put it forward in 1932 as "a common-sense type for an everyday purpose free from anything in the nature of gratuitous novelty or pleasantry" It is bolder and more legible than any type face we have hitherto used The types used for headings and cross headings of articles are based on the letter of the text fount, thus achieving harmony and unity of design throughout the pages of print—a feature still lacking in many periodicals which in other respects conform to the modern demand for legibility and "readability" The device printed in red on our title page is the work of Mr Eric Gill At page 32 this week we publish an article explaining the changes that have been made in the outward appearance of the *British Medical Journal* and the principles that underlie them

THE MILK REORGANIZATION COMMISSION

After intensive work lasting over a period of nearly two years the Reorganization Commission for Milk has presented its report to the Government [1] The terms of reference comprised an inquiry into the working of organized milk marketing schemes in Great Britain with power to make recommendations for their improvement It will be remembered that a Milk Marketing Board for England and Wales was established in October 1933, and in Scotland three distinct boards were set up, which came into operation between December, 1933 and October, 1934 The effect of these boards on milk production and distribution has been complex The producer has benefited by the virtual abolition of price competition and by the provision of a guaranteed market for all the milk he can produce The distributor has benefited from fixation of the *minimum retail price of milk which has thus* eliminated undercutting, but has been allowed no effective say in the final settlement of either the retail or the wholesale price The total volume of milk produced does not seem to have increased much, but the fact that producers have found it more remunerative to sell their milk than to use it on the farm has led to an enormous increase in the volume of milk sold for manufacture Since the use of milk for this purpose is unprofitable the retail price of liquid milk has had to be fixed at a high level in order to prevent the pool price for producers from falling too low In other words the loss on manufacturing milk has been paid for by the consumers It is not therefore surprising that in spite of the increased purchasing power of the public the consumption of liquid milk has shown practically no tendency to increase

After discussing general principles the Commission lays down three fundamental objects of organized milk marketing The first is to ensure that all the various sections interested in the milk industry are treated equitably The second is to secure that production is carried on in the areas and by the methods providing the greatest efficiency

[1] Milk Commission for Great Britain Ministry o Economic Series No pp x and London (1s)

and economy, and that the processes of distribution are conducted at the lowest cost consistent with the quality standards required and the type of service given The third is to increase the amount of liquid milk consumed by all classes of the community, but particularly by those who need it most The existing marketing boards, which are essentially organizations of producers, are unfitted to carry out all these objectives It is therefore recommended that a permanent Milk Commission should be set up to act as an independent and impartial authority, watching over the interests of producer, distributor, and consumer alike, controlling production, fixing wholesale prices, co-ordinating research, education, and publicity and planning the progress of the industry to the advantage of the nation as a whole Numerous other proposals are made It is suggested that the burden of subsidizing unprofitable milk manufacture should be transferred from the consumer to the State Taken in conjunction with proposals for rationalizing the production and distribution of milk, this would probably result in a lowering of the retail price of milk by at least a penny a quart Producers' prices and buying prices should be fixed not by bargaining but on the basis of past experience and future estimates, while retail prices should be decontrolled The resultant undercutting which might occur would be prevented by fixation of the wholesale price and by public health regulations governing the sale of milk, in areas where a monopoly was feared a maximum retail price might be laid down A system for increasing the consumption of milk, similar in principle to the present scheme for milk in schools, might be introduced, enabling milk to be supplied at a reduced cost to certain areas of the country or to certain sections of the population, such as expectant mothers, miners, factory and office workers, and so on

All these are interesting and important suggestions From the public health point of view, however, none is of such importance as that dealing with the quality of the milk supply In the words of the report, "the necessity for ensuring to the consuming public an ample supply of clean, safe milk at a reasonable price must be the overriding consideration" To do this the Commission insists on the payment of the producer according to the quality of the milk he supplies, independent of whether or not the milk is sold to the public at a higher price The importance of this last clause will be realized by all those who are anxious to improve the quality of milk production and to eradicate disease on the farms So long as the effort of the producer is made contingent on the willingness of the public to pay a higher price for its milk, no real progress in the cleaning up of the herds can be expected For the furtherance of the same object the Commission recommends that early consideration should be given to the advisability of setting up a central veterinary service for the control of cattle disease and for ensuring the proper administration of regulations governing the various milk grades The force of these considerations is amplified in an addendum to the report by Sir John Orr, who is so impressed with the public health aspect of the milk problem and the urgent need for supplying the public with milk free from risk of carrying disease that he recommends that special attention should be devoted to this aspect of the subject by the proposed Commission

It is needless to add that the recommendations made in the report for improving the quality of the milk supply will receive the unhesitating support of the medical profession, which knows only too well that any substantial increase in consumption of milk must await the establishment of confidence in its cleanliness and safety The attainment of this object involves not only the production of milk under clean conditions from preferably healthy animals, but also the pasteurization or equivalent heat treatment of all milk destined for human consumption

NASAL SINUSITIS IN CHILDREN

An important contribution to paediatrics is contained in the current issue of the *Archives of Disease in Childhood*,[1] in which Mr James Crooks deals in a masterly manner with disorders of the nasal sinuses in children His material consists of examples of infection of the maxillary antrum in 100 children Any or all of the accessory air sinuses may be diseased in children, but the maxillary antrum offers distinct advantages to the investigator The work here summarized comprised two groups of investigations One consisted of twenty-four children in whom infection of the maxillary antrum was proved by routine puncture of the antra in 100 children undergoing tonsillectomy at the Hospital for Sick Children, Great Ormond Street Such children had presumably some upper respiratory disorder, possibly due to antral infection, secondly, they could be readily punctured while under the anaesthetic for the tonsil operation, thirdly, operation would not be taking place if a "cold" was present (thereby eliminating the possibility of temporary antral infection), and, fourthly, it has been stated that removal of the tonsils and adenoids usually results in the clearing up of antral infection Any antrum found to con-

it to be possible for them to set aside spare rooms as gas proof rooms None of the methods which the Government had disclosed so far and which had been tested in London would make a room gas proof at Easingwold or elsewhere Experiments which had been worked out demonstrated that this gas proof room at Easingwold would never be worth the money spent on fitting it up and sealing it Those experiments had been carried out recently on four separate and typical rooms These rooms were sealed with the greatest care and in exact accordance with the Government's method It was not unfair to say that each of the first three rooms leaked like a sieve after the attempt had been made to make them gas proof and even the fourth room which was almost ideal for the purposes of sealing leaked like a subsidized ship

The whole fallacy of the Government's experiments was the idea that the walls did not admit air The walls of this building at Easingwold as of any ordinary building admitted air with such rapidity that on a windy day the volume of air which could enter or leave an ordinary room made gas proof by the Easingwold method in fifteen minutes was equivalent to the total volume of air in the room at any particular moment If the room at Easingwold was typical of the experimental rooms then a gas which would kill a person exposed in the open air in six minutes would kill a person inside the gas proof room in sixty minutes If the gas was so weak that it would take twenty four minutes to kill a man outside the room it would kill him inside in two hours If it took fifty minutes to kill a man outside the room it would kill him in the room in three hours We ought not to spend one penny on Easingwold to teach people to proof rooms in that ridiculous fashion If the rooms had applied to them everything that the Government desired in the way of making them gas proof they would still be in the position that a quantity of phosgene liberated three miles to windward would kill everybody in the room within two hours If by any chance the room could be made gas proof the only result would be to suffocate the inhabitants He understood that the Government proposed that five persons could live in a gas proof room 10 × 10 × 8 feet for twelve hours That worked out at half a cubic yard of air per hour per person The general Home Office figures allowed a little more than that—namely, 3/5 of a cubic yard the French allowed three times as much space and the Germans four times as much Long before twelve hours were passed all the persons in the room in order the keep alive would be breathing at four or five times the normal rate

It had been said that in many respects gas masks were fairly satisfactory, but what was being done about the people who could not wear gas masks? A very large number were under 5 years of age and they could not wear the masks and a great many persons especially in prominent positions were far too old to wear them He was told that gas masks offered a good protection against most gases but was the Home Office satisfied that if all this money was spent on this new school it would help anybody to discover whether gas masks would keep out poisonous or otherwise dangerous dusts and smokes?

Mr HUDSON replying for the Office of Works said that an air raids precaution scheme was being arranged A committee was engaged in drawing up the necessary plans for old as well as new buildings

The amendment was negatived and the vote agreed to

Mr GEOFFREY LLOYD told Mr O E Simmonds on February 10 that rubber so far as the Home Office knew was not attacked by any form of poison gas Certain gas in liquid form was absorbed by rubber but the gas could be neutralized by subsequent treatment leaving the rubber unaffected The face pieces of the gas masks now being manufactured by the Government were made of rubber

Mr GEOFFREY LLOYD replying to Mr Duncan on February 15, said that the recommended methods of gas proofing houses were taught at the Civilian Anti Gas School at Falfield and gas was discharged against a number of wooden structures which had been erected on the range there for demonstration purposes The Home Secretary was satisfied that the recommended methods of gas proofing would be effective in affording a very great measure of protection against any type or concentration of gas which might be expected in the event of gas attack from the air A room rendered gas proof by the method used at the Falfield Air raids Precautions Training School would be effectively protected if a quantity of phosgene gas were liberated three miles to windward to drift down wind on the building

On February 15 Mr DUNCAN further asked the Home Secretary if the gas masks now being produced by his Department could be worn by children and old persons without discomfort and with adequate protection against gas Mr GEOFFREY LLOYD said the respirator intended for the civilian population had been specially designed to provide less resistance to breathing than the respirator issued to the Services For this and other reasons it could be worn without discomfort by elderly persons and by children over 4 or 5 years For infants and very young children a special device was being designed The Government was satisfied as a result of exhaustive trials that the civilian respirator would effectively protect the face eyes and lungs against any type of gas which so far as was known could be used in war

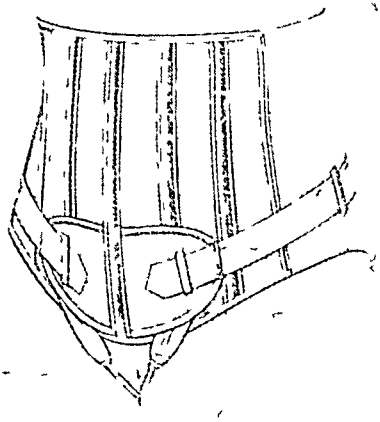
Mr SORENSEN asked if Mr Lloyd was aware that a group of scientists of some distinction after investigating this alleged precaution had declared that there was no effective precaution whatever Mr LLOYD said he was aware that some persons calling themselves the Cambridge Scientists Anti War Group had made some observations on the subject, but it was not clear whether their interest was primarily scientific or political

Declining Birth Rate

Mr J R H CARTLAND moved in the House of Commons on February 10

> That this House is of opinion that the tendency of the population to decline may well constitute a danger to the maintenance of the British Empire and to the economic wellbeing of the nation and requests His Majesty's Government to institute an inquiry into and report upon the problem and its social and economic consequences and to make recommendations in regard thereto

He said the birth rate had fallen steadily and persistently since 1875 At the same time population had increased but that increase had been brought about entirely by decrease in the death rate Within three years the number of birth would for the first time no longer exceed the number of deaths If every child that was born to day was to live to the age of maturity the birth rate would still not be sufficiently high to maintain the population at the present level The nation had twenty years in which it was possible to reverse this trend of declining population or if that was not desired then steps should be taken in the twenty years to mitigate the disadvantages which appeared likely to arise The first practical step was the appointment of an official inquiry and the question why people were having fewer children to day would be the first question that inquiry would have to consider In the next eight years 500 000 fewer juveniles would be available for employment What was going to happen when the stream of juvenile labour became a mere trickle?



The report of the Chief Medical Officer of Health for 1935 stated

> It is probable that the change in age-distribution will continue If this forecast be correct the outlook upon the provision of many of the social services must undergo a gradual alteration on the one hand are for example maternity and child welfare work schools institutions for the normal and abnormal young and isolation hospitals on the other hand institutions for the care of the aged and old age pensioners

The point the Chief Medical Officer made was that there was bound to be a reorganization of the health services But what about housing? At the moment the supply of houses was about 1 000 000 a year It had been estimated that in twenty years from now the housing need would drop to 400 a year and that in twenty years the House would also have a problem of redundant schools There was bound to be a big increase in the number of pensions paid to people of old age and to widows and also to blind persons The Ministry of Health could not do much more in lowering the death rate which had been pretty steady since 1910 The expectation of life in this country had been increased by twenty years,

Salt and Son Ltd

A CORRECTIVE SUPPORT FOR THE ENTIRE VISCERA

SALT'S VISCEROPTOSIS BELT

The principal characteristic of SALT'S VISCEROPTOSIS BELT is that it affords support for the **whole** of the viscera in addition to uplift of the lower abdomen. For this reason the Belt is also extensively used for post-operative cases where support above the umbilicus is needed. The consistent efficiency of SALT'S VISCEROPTOSIS BELT obviates the necessity for corsets in many cases. In Salt's Corset and Belt Book further details of this particular Belt are given together with information about the entire range of Salt's individually made Appliances. Handy Measure/Order forms are included on every page for the doctor's use. Practitioners are invited to apply for this Book which will be sent post free to Medical Men.

and tribute was due in that connexion to the work by the Ministry of Health It was likely that the Ministry would be able to extend maternity services considerably and make a greater reduction in the number of deaths of mothers and children of early age, but that saving of life would not reverse the whole trend, which had been going on since 1875

THE QUESTION OF BIRTH CONTROL

Mr E D SIMONS seconded the motion He said the main reason for the decline in the birth rate was increased knowledge and practice of birth control To forbid birth control by making it illegal would, in the opinion of most members, be a retrograde step, and they did not wish by legislation to create large unwanted families The course which would commend itself was to alter social and economic conditions to make people desire large families One practical thing could be done immediately on the committee stage of the Factory Bill by incorporating in that Bill six weeks' cessation of work before as well as after childbirth, with a maintenance allowance for the woman and her child Extension of nursery schools and crèches would bring great relief to the mothers, and no inquiry would be complete without investigation of the relation between housing conditions and population The cost of education played a big part in the limitation of families among certain sections of the population

Mr H PARKER said the Labour Opposition welcomed the suggestion that the Government should hold an inquiry into the population question If the birth rate was to be increased people must be convinced that the maintenance of the race was desirable There must be better maternity services, proper nutrition, and jobs for children when they became adults Although at the present time a decline of birth rate was observed when the conditions of the people began to improve, yet good conditions made possible a longer period of childbearing and Professor Carr Saunders had pointed out that this came to an end earlier among the labouring than among the richer classes

ECONOMIC AND SOCIAL CAUSES

Mr RICHARD ACLAND said birth control had not yet reached its maximum effect and he believed it would be wholly improper to oppose it Children's clinics to day were spreading healthy methods of birth control The number of patients who came to the clinics to obtain advice as to how to have a child was equal to the number who came to ask for advice on how to avoid having one The trouble was that the nation was profoundly ignorant of the causes which induced childlessness They should point out to potential parents that their children at the age of 20 would not suffer the competition for jobs which the present men of 20 suffered

Sir FRANCIS FREMANTLE said it was true that contraceptive methods enabled the decline in the birth rate to take effect rapidly, but long before these came within reach of the general mass of the people the decline had begun Luxury in its real sense was possibly one of the greatest factors Everyone wanted to be equal with his fellow, and there had come a stage when the desire for luxury and comfort had become a real factor in the question of population The time was ripe for further inquiry, but the House must expect more from general publicity and from open discussion of the subject

Mr F A BROAD said the question was one of the psychology of life of the mass of the people and not one of poverty people at the means test level had the biggest families One of the factors preventing younger people having families was lack of housing accommodation

GOVERNMENT INQUIRY

Mr ROBERT HUDSON speaking for the Ministry of Health, said the Government proposed to accept the motion Since 1933 for the first time in our history the birth rate had remained stationary for four years in succession, and had not continued to fall The actual birth rate for the last two years had shown a slight rise Contraceptive methods were the means and not the cause of the declining birth rate Some believed that recent propaganda in favour of the maternity services had decreased the birth rate by inducing a fear of confinement, but out of an average death rate of 1,355 per 100,000 among women only sixteen deaths were the result of pregnancy and childbirth That could have no material effect in reducing the birth rate, but was more likely to be a psychological factor The badness of rural housing might have a serious effect on the birth rate in the country, and the Ministry of Health was persistent in urging local authorities to improve it They had still to decide whether there was any economic urge to reduce families and any possibility of altering it At present there was a large preponderance of persons in the prime of life, and a time must follow when there would be an excess of older age groups The present adult population resulted from years when the number of births per annum was around 900,000 The juvenile population of to day sprang from years when the birth rate was between 500,000 and 600,000 per annum, and the number of old people was also the result of that time The estimates of the future population which were being made to day and had been quoted in the debate were quite possibly equally wide of the mark with those made one hundred years ago *The Government did not propose to set an inquiry on foot* but to intensify its own inquiry It would welcome any assistance, but the matter was essentially one for the Government, not for outside societies He hoped that the inquiry would obtain enough information to indicate what the future policy should be

Mr MORGAN JONES asked if it would be a Departmental inquiry Mr HUDSON indicated assent, but said he could not now give any pledge that an interim report would be issued during the lifetime of the present Parliament

After further discussion the motion was agreed to

Non-tuberculous Employees at Papworth

Mr ROWSON asked on February 11 if the Minister of Health knew that young men from the distressed areas and from Government training centres who were not suffering from tuberculosis were employed in Papworth workshops Cambridgeshire, and worked side by side with persons suffering from tuberculosis, and if he had obtained the opinion of his medical experts whether or not this practice, from a health point of view, was desirable and should be allowed to continue Sir KINGSLEY WOOD said he was aware of these facts The young men worked in hygienic workshops and also in the open air They knew before they came that they would be employed in a tuberculosis village settlement They did not reside there The tuberculous patients were under constant medical supervision and were trained in the necessary precautions to guard against conveyance of infection Under these circumstances he was advised that no special risk was involved

Sir FRANCIS FREMANTLE asserted that every precaution was taken at Papworth, and that there was practically no risk in these persons working side by side

Mr ROWSON said that the sole purpose of setting up sanatoria was to avoid infection and contagion He gave notice that he would raise the matter on a motion for the adjournment and give the House further information

Divorce in Scotland

In the House of Lords, on February 11, Lord ALNESS moved the second reading of the Divorce (Scotland) Bill which extends the grounds on which decrees for divorce may be granted in Scotland He said that the first ground for divorce in the Bill was that of desertion, and the second insanity The period provided by the Bill during which the insanity must subsist was three years The majority report of the Royal Commission held that insanity (*a*) defeated the purpose of the marriage relationship; (*b*) made marriage as a contract impossible of fulfilment, (*c*) lay outside the reasonable contemplation of the parties at the date of the marriage, and (*d*) differing from all other bodily disorders, involved the removal of the insane person and so brought to an end every phase of marriage The first of two objections which had been taken to insanity as a ground for divorce was that the

insane person might recover The evidence before the Royal Commission established that after five years the cases of recovery were only 1 per cent, and after three years a very slightly higher ratio Moreover, in the rare cases of insanity it was surely eugenically and otherwise undesirable that the parties should resume cohabitation and should breed Insanity might recur at any time Again, it was objected that lunacy was a misfortune not a fault That was true but after all divorce decrees were not handed out on the footing either of punishment or reward There were in Scotland 20 000 insane persons confined in asylums and many of them were married The Board of Control had not been able to provide him with the precise figures of those who were married but it could not be disputed that there were at any rate thousands Other grounds for divorce under the Bill were cruelty penal servitude following on a sentence to that effect or a death sentence which had been commuted to penal servitude for life The Bill also provided that conviction three times of a crime since the marriage and within five years of the raising of an action for divorce and sentence of imprisonment for not less than six months—the crime involving either dishonesty or personal violence—should be grounds for divorce Habitual drunkenness was to be another ground

Lord MACMILLAN in supporting the Bill, said that although lunacy had not hitherto been a ground for divorce in Scotland it had commended itself to the Royal Commission Lord STRATHCONA said at that stage he could not express either approval or disapproval of the principles of the Bill It must rest with their lordships to decide according to their convictions

The Bill was read a second time

Regional Store Depots for Gas Masks—Mr GEOFFREY LLOYD announced on February 4 that two regional store depots for the storage of gas masks had been acquired one at Manchester and one in the London district These had between them a capacity of about 4 000 000 gas masks and facilities for their inspection and preservation Eleven more regional store depots would be needed and urgent steps were being taken to obtain them The system of distribution from these regional store depots was under investigation and it was hoped that a suitable working arrangement would be devised which would include the use of local store depots each with a capacity of about 30 000 gas masks More detailed information on the preparation of air raid shelters in private houses would be given by the handbook now in preparation A handbook for factories and business premises was already published by the Air Raid Precautions Department

Scottish Maternity Homes Nursing Staff—Mr ELLIOT replying to Mr Leonard on February 9 said that there were 129 maternity homes registered under the Midwives and Maternity Homes (Scotland) Act 1927 He had no particulars at present of the numbers and qualifications of the nursing staffs employed in them, but he was taking steps to obtain information from the local authorities by which the homes were registered These authorities had wide powers under the Act to secure an adequate standard of nursing

Post Dental Surgical Treatment—On February 9 Mr HUDSON informed Mr Duckworth that the Minister of Health had no power to submit to any tribunal the general question whether post dental surgical treatment should be a matter for the dentist or for the surgeon The question whether any particular treatment was a service which a doctor could be called on to render under his insurance contract could be settled only on the facts of each individual case

Investigation of Silicosis Deaths—Captain CROOKSHANK replying on February 9 to Mr J Griffiths said that inspectors made full inquiries into all cases of deaths of miners alleged to be due to silicosis in order to study the causes and give advice on appropriate preventive measures Experience had shown that the present methods of inquiry were more effective for these purposes than the attendance of inspectors at inquests and he did not propose to revert to that arrangement which ceased in August 1935, on his instructions

Medical News

A conference of the British Health Resorts Association will be held at Bournemouth Town Hall on Saturday, March 13, when there will be discussions on Wintering in England and The Curative Action of Sea Climate All medical practitioners are invited to attend

The British Association of Radiologists invites medical members of the British Institute of Radiology to a meeting at the Royal Society of Medicine to day (Friday February 19) at 5 30 p m, when Dr E Lysholm of Stockholm will give an address on Radiological Possibilities of Demonstrating the Exact Location Size and Pathology of Intracranial Expansive Processes

At the meeting of the Central Midwives Board for England and Wales on February 4 the following resolutions were passed (1) That as the term of office of every examiner on the list, as set out in a resolution of the Board dated April 4 1933 has not yet expired the list of examiners as submitted be approved for the year commencing April 1, 1937 (2) That the list of lecturers as submitted be approved for the year commencing April 1, 1937

The St Vincent Association has arranged a dinner to be held at the Old Cheshire Cheese Fleet Street on February 26, at 6 30 p m when Mr Hector Hughes K C, and Dr F W Crossley Holland will speak on Some Legal Aspects of Medical Representation The hon secretary is Mr H A Mumford Chalfont Court Baker Street, N W 1

The next meeting of the European Society of Orthodontia will be held in Brussels under the presidency of Dr De Coster on May 17 and 18 Further information can be obtained from the secretary, Mr G F Cale Matthews, 95, Newhall Street Birmingham

The seventeenth salon for the exhibition of works of art by doctors dentists pharmacists and veterinary surgeons will be held at the Galerie Bernheim Jeune 83 Faubourg St Honore Paris from March 14 to 21 Further information can be obtained from the general secretary Dr P B Malet 46 Rue Lecourbe Paris 15e

A joint meeting of the Fever and School Medical Groups of the Society of Medical Officers of Health will be held at 1, Thornhaugh Street Russell Square W C on Friday, February 26, at 5 30 p m when there will be a discussion on the control of whooping cough

A meeting of the Medico Legal Society will be held at 26, Portland Place, W on Thursday February 25 at 8 30 p m when a paper will be read by Mr Paul C Davie on Silicosis An Administrative Experiment

The annual court of King's College Hospital over which Lord Wakefield will preside on Tuesday February 23 at 5 p m, will be followed by the opening of a new wing for private patients which has been given by the generosity of friends of the hospital on the Stock Exchange

A meeting of the Section of Medicine of the Royal Society of Medicine will be held on Tuesday February 23 at 5 p m when a discussion on 'Milk as a Factor in the Cause of Disease' will be opened by Dr W G Savage, Professor G Selby Wilson and Professor F C Minett

The German Society of Internal Medicine will meet at Wiesbaden from March 15 to 18 under the presidency of Professor Siebeck when the subjects for discussion will be the new foundations of nutrition dietetic treatment of diabetes, the pathology of the thyroid, the origin of endemic goitre and tuberculosis as a general disease Further information can be obtained from Professor Siebeck, 1 Medizinische Klinik Berlin N W 7

At a meeting of the Illuminating Engineering Society to be held at the Lighting Service Bureau 2 Savoy Hill W C at 6 30 p m on Tuesday February 23 a paper on diffusion and shadows will be read by Mr Howard Long

'EUPINAL'

(IODIDE OF CAFFEINE)

Combining the therapeutic properties of caffeine and of the iodides in a specially elegant and effective form EUPINAL is being increasingly adopted in cases of asthma chronic bronchitis and in affections of the cardio vascular system It is free from toxicity has no cumulative effect and is well tolerated even when prescribed over long periods A fully descriptive booklet dealing with the Pharmacology etc of Eupinal is available upon request

Speaking at the annual dinner of the Yorkshire Association of Medical Women at Harrogate, Dr Letitia Fairfield said 'From the day that women were allowed to join the British Medical Association the Association had realized that in our interests and in their own it is essential that we should have equal pay for equal work That sticks very hard in some people's teeth'

The issue of the *Bulletin de l'Office International d'Hygiene Publique* for December, 1936, is devoted to yellow fever

The *Journal of the American Statistical Association* for December, 1936, contains a fine appreciation of Karl Pearson, who died on April 27, 1936, by Professor Raymond Pearl of Johns Hopkins University

The issue of the *Wiener medizinische Wochenschrift* for February 6 is dedicated to the memory of Professor Leopold von Schrotter on the occasion of the centenary of his birth

The current issue (August–October) of *Cirugia y Cirujanos*, the official organ of the Mexican Academy of Surgery, contains a sympathetic obituary of Lord Moynihan, with his portrait

Dr Edward E Prest, who is retiring after twenty-nine years as medical superintendent of Glenafton Sanatorium, New Cumnock, Ayrshire, attended a meeting on February 13 to receive a silver salver from the staff and a canteen of cutlery and a wireless set from subscribers in and outside the county

During the week ended February 13 the number of deaths ascribed to influenza in the 122 great towns (including London) of England and Wales was 697, compared with 976 in the preceding week In London the number of deaths from influenza was 50, against 101 in the preceding week, and the notifications of influenzal pneumonia in London were 94, against 132

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL B M A House Tavistock Square W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone, unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House Tavistock Square, W C 1 on receipt of proofs Authors over seas should indicate on MSS if reprints are required, as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE *BRITISH MEDICAL JOURNAL*, *Articulate Westcent London*

The address of the B M A Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh*, telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I M A and B M A) 18 Kildare Street, Dublin (telegrams *Bacillus Dublin*, telephone 62550 Dublin)

QUERIES AND ANSWERS

Nephritis Following Gastric Ulcer Therapy

DR H TREVOR RYAN (Cork) writes People treated for gastric disorders with colloidal kaolin or magnesium trisilicate sometimes show signs of renal damage after a prolonged course of treatment The albuminuria may be very slight and the presence of red blood cells will be overlooked unless they are sought for in the centrifuged deposit Severe nephritis which I ascribe directly to the use of these compounds, has developed in three cases that have come to my notice I should be interested to know if any of your readers have had any similar experience

LETTERS, NOTES, ETC.

Memorial to Dr Hennessy

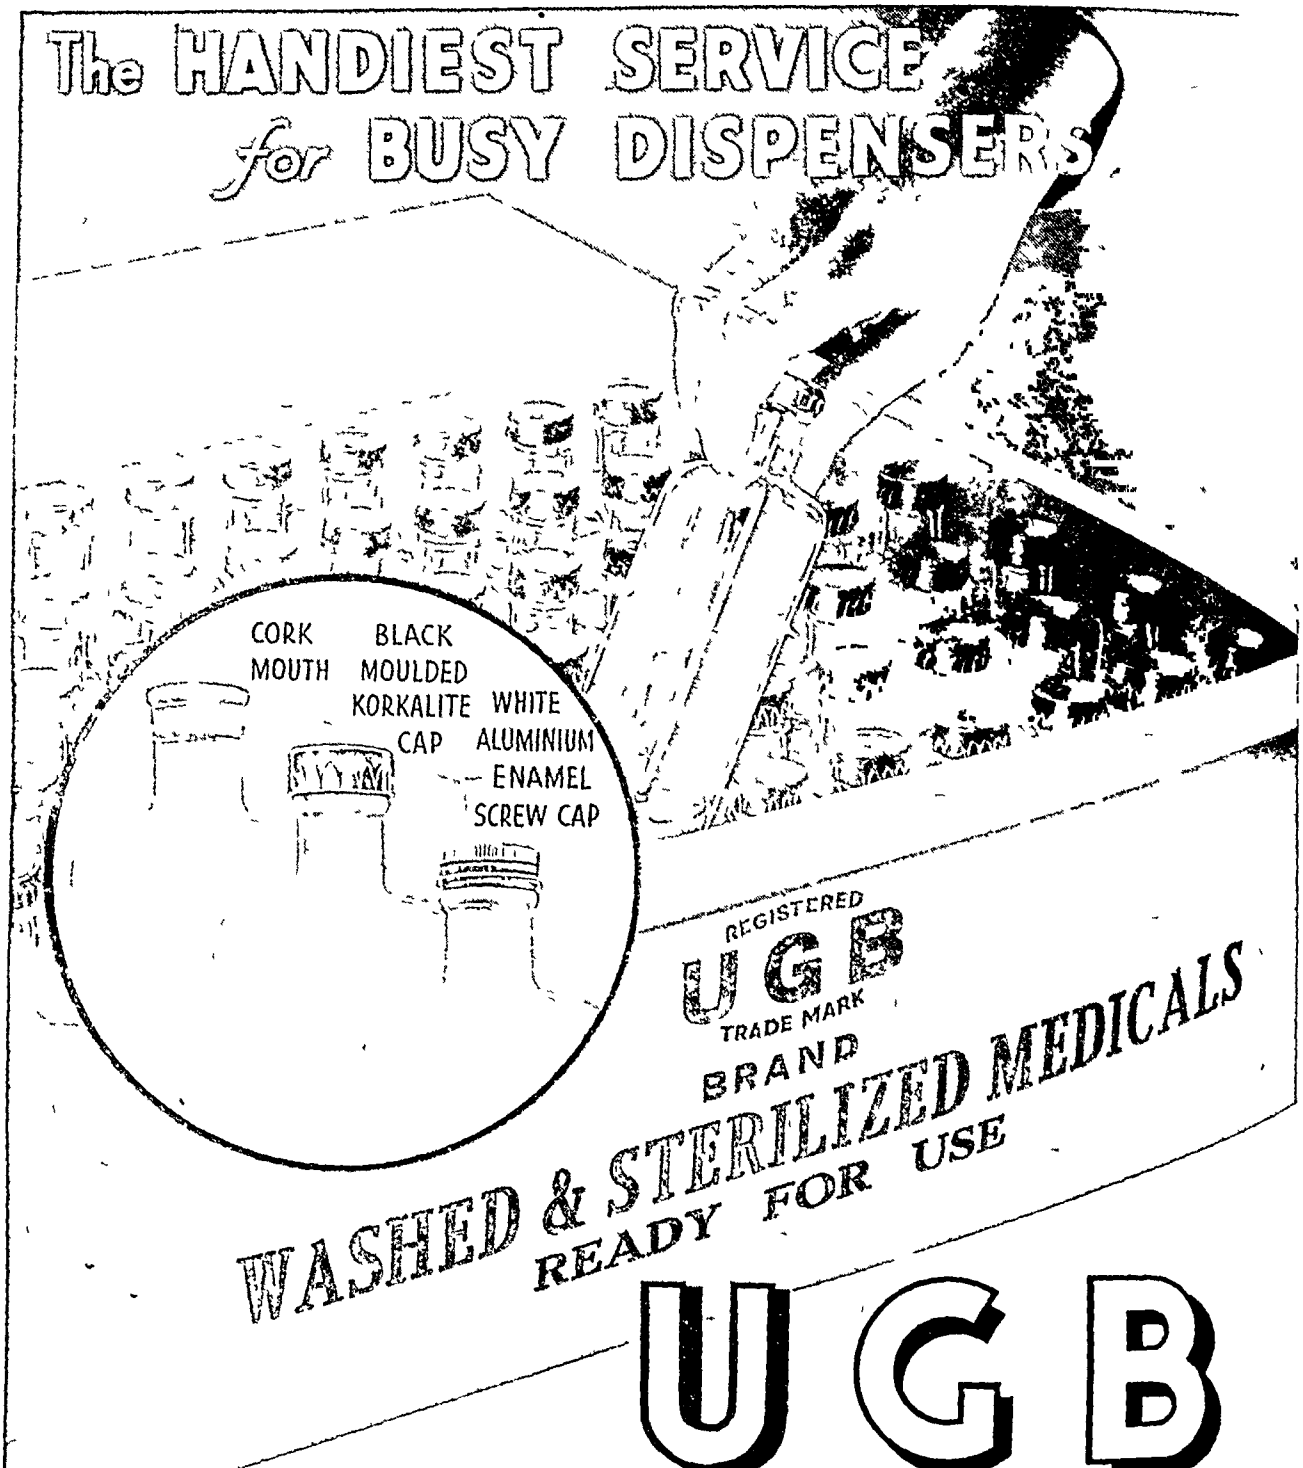
The proposal to found a memorial to Dr Thomas Hennessy who was Irish Medical Secretary of the British Medical Association from 1914 until his death at the beginning of last year, was announced in a circular letter reproduced in the *British Medical Journal* of August 29, 1936 (p 440) The chairman of the fund Dr C J MacAuley the honorary secretary, Dr J P Shanley, and the Medical Secretary of the Irish Free State Medical Union (I M A and B M A) inform us that the fund will be closed definitely on March 1 1937, and that further contributions will be gladly received before that date These may be sent to the honorary secretary, Hennessy Memorial Fund, 18, Kildare Street, Dublin

Obstetrics and Gynaecology at Otago

The second report of the Department of Obstetrics and Gynaecology in the University of Otago, New Zealand, deals with one thousand consecutive deliveries and the concurrent work of the Gynaecological Section, covering the period from March, 1934, to May, 1936 inclusive The previous report, issued in 1934, recorded a similar series of one thousand deliveries conducted without a maternal death In the series now reviewed three deaths are reported, comprising one case of eclampsia admitted moribund one of cerebral haemorrhage in the thirty first week of pregnancy, and one of post partum haemorrhage at full term The maternal morbidity, however, is unusually low, with a rate of only 0 7 per cent of cases classed as morbid in accordance with the B M A standard During the same period there has been a marked diminution in the death rate from puerperal sepsis through the whole of New Zealand Of the seven cases of maternal morbidity cited in the report six were of mild pyrexia, and one only of notifiable puerperal sepsis In the last named case the condition followed a combination of adverse circumstances —namely contracted pelvis, high forceps, episiotomy, lacerated vagina, post-partum haemorrhage and manual removal of the placenta The report also deals with 1 056 gynaecological cases, of these 268 underwent abdominal and 51 vulval or vaginal operations, the remainder receiving conservative treatment Of the total 935 are noted as cured and a further 103 as relieved Post operative mortality was only 0 77 per cent, and three of the six deaths in this group were due to *pulmonary embolism*

Academic Costume

"X Y Z" writes The approach of the Coronation has stimulated an interest in uniforms and robes Anyone who has attended medical meetings at which academical dress is worn must have noticed the inadequacy of that present day for the holders of certain qualifications, including very high qualifications, of the various medical corporations in contrast with those of the universities Those who have studied academic costume are aware that from time to time alterations have been made I suggest that this year is an appropriate time and would be a gracious act if the authorities of the great institutions whose robes do not at present possess a hood added an appropriately coloured one and made it retrospective (it would affect approximately 75 per cent of registered medical practitioners) in commemoration of the Coronation of King George VI



*** The hood is a badge worn over the gown to indicate a degree Since corporations other than universities do not confer degrees 'X Y Z s' suggestion seems to be impracticable

Corrigenda

We regret that in our account in the *Journal* of February 13 (p 347) of the discussion on peripheral nerve injuries at the Royal Society of Medicine *Mr John P Hosford's* name was wrongly given as Mr Reginald Hosford (p 348)

In our review of *An Ethiopian Diary* by Dr J W S McCullough (February 6, p 273) the University Press of Liverpool should have been mentioned as publishers

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

132 Gastro intestinal Affections and Haematopoiesis

A ADLER (*Zbl inn Med*, January 2, 1937, p 2) discusses the relationship between gastro intestinal affections and haematopoiesis The anaemia in gastric achylia is well known It is most common in women and is undoubtedly partly of endocrine origin Anaemia has also been described following gastro enterostomy or resection of the stomach Pernicious anaemia has also been observed in megacolon, in Herter's infantilism, in disturbances caused by goat's milk, sprue, and cirrhosis of the liver The author cites in detail a number of cases of gastrogenous anaemia and of enterogenous anaemia

133 Prognosis of Hyperpiesis

C SCHWENSEN (*Ugeskr Laeg* December 17 1936 p 1264) has investigated the subsequent careers of the 412 patients who between January 1, 1925 and January 1, 1935 were admitted to a public hospital in Denmark with a blood pressure of 170 mm Hg or more These were unselected cases which as a class differed from the patients found to be suffering from hyperpiesis on application for life insurance in that hospital material must represent a comparatively advanced stage of hyperpiesis 64 per cent of the author's patients were women Inquiries made in 1935 yielded information about 85 per cent of these patients In the first five years of the period under review there were 188 patients of whom 159 were traced By the spring of 1935 ninety five (60 per cent) had died The mortality in this group was 74 per cent for the men, 50 per cent for the women *It should be noted in this* connexion that nearly all the men were over 50, whereas about one third of the women were under this age As for the men the mortality was not proportional to the height of the blood pressure but the prognosis for the women grew worse with rising blood pressure A classification of the material according as the hyperpiesis was or was not associated with demonstrable renal disease emphasized its seriousness The author concludes that from the life insurance point of view hyperpiesis by itself is a very inadequate guide to prognosis that one or two measurements of the blood pressure yield little valuable information, and that only a comprehensive survey of the whole situation, with due reference to the cardiovascular and renal systems can enable the examiner to form a sound opinion of value to a life insurance company and the patient And if insurance refers to invalidism account must be taken of the high proportion of hyperpietic patients who, even if they escape early death, are more or less unfit for work

134 Allergic Skin Tests in Rheumatism

O B BODE and A SCLUETER (*Dtsch med Wschr* December 25, 1936, p 2125) have conducted a series of skin tests on rheumatic patients and controls with the object of verifying the claims recently made by Professor F Gudzent of Berlin Following his technique and employing the same reagents (rheuma—and gichtallergenine of the Sachsischen Serumwerk), the authors tested fifty rheumatic patients, of whom forty two suffered from arthritis or gout, five from muscular rheumatism and three from sciatica Among the fifty non rheumatic controls were no patients suffering from diseases which could be interpreted as allergic Positive reactions were observed in forty five of the rheumatic group among the five giving no reactions were two patients suffering from typical subacute polyarthritis Skin tests with a variety of antigens representative of fish meat vegetables milk, eggs, bacteria etc, showed that fish came first numerically in importance as a generator of positive reactions Among the fifty non rheumatic controls there were as many as forty giving positive reactions and in this group too sensitiveness to fish was numerically and comparatively important Comparing their own findings with those of Gudzent the authors note that he obtained positive reactions in 96 per cent of his rheumatic patients and in only 11 per cent of his non rheumatic controls The authors are also unable to confirm Gudzent's observation that several of his patients experienced an exacerbation of their symptoms after the consumption of foods towards which skin tests had shown them to be very sensitive The authors do not however, disclaim all belief in the allergic character of the rheumatic diseases but in their opinion factors other than the original causative agent overshadow it when the disease has lasted for some time *This is probably as true in rheumatism as it is in asthma* and desensitization in many cases of rheumatism is probably effective without being strictly specific in the sense that the remedy corresponds exactly to the original morbid agent

135 Tuberculous Bacilluria

F STUDER (*Dtsch Tuber bl* January, 1937 p 7) has investigated the urine of 700 tuberculous patients for the presence of tubercle bacilli The urine sediment was injected into guinea pigs In 615 cases the result was negative and in eighty five cases positive In the positive cases the presence of tubercle bacilli in the urine could be traced to a tuberculous focus in the genito urinary system True tuberculous bacilluria could not be demonstrated in a single case In every case where leucocytes are present in the urine in increased quantities the urine should be investigated for the presence of tuberculous bacilli not only microscopically but also by culture and by animal experiment

Surgery

136 Oesophageal Surgery

RADLINSKI (*Bruv med* December 6 1936 p 202) describes a case of cardiospasm in which the oesophagus was dilated to a diameter of 12 cm and greatly increased in length Barium was visible in the oesophagus for forty eight hours The patient had suffered from pain digestive disorder and loss of weight for several years Operation was carried out after laparotomy the upper part of the stomach and cardia was freed the oesophagus was dissected free and drawn down into the abdomen the cardia was then resected and the oesophagus invaginated into the gastric opening After suturing the anastomosis was reinforced by an omental graft The result was excellent the gastrostomy previously performed closed spontaneously at the end of three weeks and radiography showed that the oesophagus had diminished in calibre and length and emptied in twelve hours A second case is reported in which carcinoma of the cardia was removed although it had invaded the end of the oesophagus The procedure was as follows the site of the growth was freed and the oesophagus was mobilized and drawn down through the oesophageal opening of the diaphragm into the abdomen The oesophagus was then ligatured above the tumour the ends of the ligatures being left long and the oesophagus was divided below the sutures The stomach below the tumour was also divided and the growth removed Suture of the incision in the stomach was then carried out followed by a gastrostomy The ligatured portion of the oesophagus was drawn into the upper part of the wound Eight days later it was found that the lower end of the oesophagus was fixed by adhesions Eventually it is

. . talking of arpeggio and aria

Yes, but smoking Player's

Perhaps we're wrong with that headline — the topic may be thirst, one thing however, is pretty sure—the Cigarettes are Player's Whatever the talk whatever the walk of life, Player's are consistently chosen for the greater pleasure they give The reason lies clear in the Player maxim 'It's the Tobacco that Counts"

now here's a most enjoyable movement help yourself .

hoped to join the exteriorized oesophagus with the opening of the gastrostomy by means of a rubber tube, thus allowing fluids to be taken by mouth

137 Kohler's Disease of the Scaphoid

WILLY SMETS (*J Chir*, Brux, November, 1936, p 390) in a study of Kohler's disease of the scaphoid has distinguished two characteristic forms that which is typical of the disease and that which is complicated A study of the literature in 171 cases has enabled the author to give a detailed review of the subject The disease is primarily one of childhood, occurring between the fifth and tenth years as ossification of the scaphoid takes place It is seen twice as often in boys as in girls, and in the case of boys the disease appears to develop at a rather later age The condition is usually unilateral, and out of 157 cases it was bilateral in only thirty-three Changes in the scaphoid are not always accompanied by symptoms, and may only be discovered as a result of x-ray In the typical form of the disease the child limps, complains of pain on the inside of the foot, and walks with the outer side on the ground Slight oedema may be seen over the instep The skin may be slightly reddened, with increased warmth, and there is pain on pressure localized over the scaphoid The movement of the tibio tarsal joint is painless, but torsion or adduction of the foot causes pain The general condition is usually good, the x-ray appearances are characteristic and unmistakable In typical cases the prognosis is good, but in the complicated form there may be abscess or sinus formation, necessitating subsequent amputation This development is seen particularly in cases of tuberculous scaphoiditis In these cases treatment should consist of immobilization in plaster and heliotherapy, with treatment on general lines If a cold abscess is present it should be aspirated after injection of a modifying liquid When a sinus forms curetting or removal of the scaphoid may be necessary In the simple typical form of the disease it may only be necessary to guard the foot against any rough usage, to give local irradiation, calcium, and vitamins If the scaphoid is painful and swollen rest in bed combined with ultra-violet ray therapy and medical treatment may be sufficient, unless the child is particularly active when immobilization in plaster may be necessary Flat-foot may be avoided by wearing a raised sole Anti-rachitic treatment should be given in all cases, and when thyroid insufficiency is present this should also receive attention

138 Blood Vessel Tumours of the Scalp

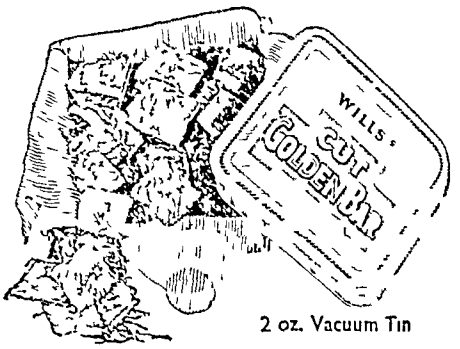
LAMBERT ROGERS (*Austral New Zeal J Surg* October, 1936, p 99) states that the majority of blood vessel tumours of the scalp represent developmental anomalies in the vascular bed of a particular region of the scalp rather than true tumours Sometimes a haemangioblastoma is present as well as the irregular arterio-venous anastomosis, which constitutes the bulk of the lesion If untreated these tumours may cause fatal haemorrhage or much discomfort through the buzzing and throbbing sensations they produce They are liable to recur if radical treatment is not carried out, but this presents the danger of haemorrhage Two cases are reported in the first of these an associated angiomatous malformation and haemangioblastoma were seen in a man of 21 years He suffered from headache and shooting pain in the region of a dark red scalp tumour on the forehead, which was ulcerated and discharging The lesion was excised successfully In the second case an angiomatous malformation was seen in a man of 20 years He complained of buzzing whirring and throbbing noises in the head, especially when lying down There was an extensive, diffuse pulsating swelling over the right side of the skull Operation was carried out and the greater part of a vascular mass was dissected out The patient made a good recovery and was completely free from discomfort and symptoms The lesion is most often seen in young men between the ages of 20 and 30, who complain of headache and of buzzing and whirring, caused by the blood flow through the anastomosing vessels The ideal treatment is by complete excision of the lesion, and a procedure is described by which haemorrhage is controlled Before excision the lesion is almost surrounded by overlapping sutures, passed through the thickness of the scalp down to the outer table of the skull, these sutures are tied and left in position for a week During excision haemostasis is further controlled by reflecting the epicranial aponeurosis over the edges of the incision by means of multiple artery forceps In the two cases reported there was practically no loss of blood

Therapeutics

139 Blood Transfusions in Scarlet Fever

A ZUKOV, A CHERKET, V SAVOIKO and V MYSTCHITSKY (*J med*, Kiev, vol vi, F 3, p 842) report the results of treatment of ninety-three cases of scarlet fever by means of blood transfusions In the majority of cases the blood came from donors who have never had scarlet fever The transfusion usually took place at the beginning of the disease, mainly between the second and fifth days The quantity of blood varied between 100 and 300 c.cm according to the age of the patient In sixty one cases the results were very good The temperature fell to normal in six to ten hours, and at the same time there was a subsidence of the toxic and exanthematic symptoms The cure was complete in two to three days In twenty four cases there was a marked improvement The fever subsided partly and the disease followed an attenuated course In eight cases complicated by other affections there was no change In six severe cases there was a pronounced reaction following the transfusion, then the fever subsided and remained normal The effect of the transfusion was particularly marked where the toxic symptoms were more pronounced than the inflammatory symptoms The blood transfusion was more effective than the injection of anti toxic sera The authors are of the opinion that the blood transfusion has no specific effect, but that the curative effect is due to colloidoclasty The blood transfusion does not prevent complications occurring in scarlet fever The authors recommend blood transfusion in all severe cases of scarlet fever, particularly in the toxic forms The injected blood should be fresh, citrated, and given as early as possible The authors have also tried in thirteen cases of scarlet fever small doses—0 25 to 0 5 c.cm —of cytotoxic anti-reticular serum The results were the same as after blood transfusion

140 Exophthalmic Goitre



O CHIEVITZ, A HECHT JOHANSEN, and E MOLLER (*Hospitalstidende*, December 8, 1936, p 1297) report from the Finsen Institute and Radium Station in Copenhagen their observations on forty-seven women and six men between the ages of 17 and 70 treated for exophthalmic goitre between 1933 and 1935 The average duration of the disease between its onset and the patients' admission to hospital was just over two years Thyroidectomy was performed on forty-nine of these patients, one of whom died of thyroid intoxication after the operation The immediate results in all the other cases were excellent, the patients expressing their delight with the results In their survey of the whole position the authors find three great recent changes (1) There is a growing appreciation of the importance of careful pre operative treatment which is capable of greatly reducing the operative mortality The ten to fourteen days hitherto considered adequate for such pre-operative treatment are, in the authors' opinion, not enough (2) Thanks to the benefits of pre operative treatment the indications for operation have been widened and efforts are now made to operate earlier than heretofore, not only on moderately severe cases but also on both mild and severe cases (3) The indications for

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILISER

Patent No 427581

- **EFFICIENT AND RAPID STERILIZATION**
- **SAVES TIME, SPACE AND MONEY**

Maw Sterotherm Automatic Sterilizers have been installed in many Hospitals, Surgeries, etc, throughout the country and are functioning with the utmost efficiency
The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings, etc, by the Hot Air method It is the ideal unit where economy of space and outlay are essential

May we send you details or arrange a demonstration?

SPECIAL FEATURES

- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ inches, diameter 9½ inches

PRICE £20

S MAW, SON & SONS, LTD, 7-12, ALDERSGATE ST, LONDON, E.C 1

operation have become more precise In the authors opinion the contraindications to operation are a basal metabolism exceeding 140 per cent absolute circulatory insufficiency any age under 18 and pregnancy But in four cases the first contraindication was ignored and in one case the patient was under the age of 18 at the time of operation The evolution in the treatment traced by the authors points they consider to the drafting of this class of patient into certain hospitals in which intimate co operation has been established between specialist surgeons and physicians, and it is such co operation which has been secured at the Finsen Institute

Diseases of Children

141 Measles and Tuberculosis

N Carrara (*Pediatria* Naples, December 1 1936 p 1041) reviews the literature dealing with the relations between measles and tuberculosis and records his observations on 1470 children aged up to 12 years admitted to the Paediatric Clinic at Milan during the period 1932–5 His conclusions are as follows (1) The incidence of reactivation of tuberculosis following measles is only moderate (11·2 per cent) The old doctrine, therefore, according to which measles is almost inevitably a tuberculogenic disease no longer holds good There are however certain cases in which there is an obvious relation between the two diseases, especially acute forms of tuberculosis (2) Reactivation of tuberculosis following measles is four times more frequent in the first five years of life than subsequently (3) It does not seem that measles increases the predisposition to tuberculosis as this is not more frequent in patients who have had measles than in those who have not had it (4) The prophylactic use of convalescent serum is an excellent method of preventing reactivation of tuberculosis

142 Banti's Syndrome

L C Martin (*Arch Dis Childh* October 1936 p 233) points out that haematemesis is a rare event in childhood but it is found in splenic anaemia and in Banti's disease The distinction between these two conditions is ill defined they are commonly regarded as synonymous and either diagnosis is applied to a case exhibiting splenomegaly and anaemia of obscure origin with or without haemorrhages, hepatic enlargement and anaemia Four cases of Banti's disease are recorded in full and a complete blood picture is given in all the children The diagnosis of Banti's disease is seldom made before one of the major symptoms such as haematemesis or grave anaemia has arisen Syphilis and acholuric jaundice must be excluded before such a diagnosis is made Syphilis may exactly simulate Banti's disease as in a case recorded, and enlargement of the liver and spleen is found in acholuric jaundice—hence the Wassermann test and a determination of the fragility of the red blood cells are essential investigations It is suggested that the term Banti's disease be confined to those cases showing splenomegaly and secondary anaemia with or without haemorrhage and hepatic cirrhosis but in which no aetiological factor is present Two of the recorded cases had splenectomy with good results and no untoward symptoms at the time or after operation were seen

143 Prematurity

Daniel A Wilcox (*Amer J Dis Child* October 1936 p 848) gives an account of the methods followed and the results obtained in a series of 330 premature infants The period chosen was five years and the infants were born in the public wards of a city hospital Three standards are available for defining prematurity (1) the period of gestation (2) the length or (3) the weight of the infant at birth Of these the period of gestation has been honoured by tradition, but is discarded here on account of its unreliability Similarly it is difficult to exactly measure the length of an infant so that the criterion of weight is taken as the most reliable A separate nursery is provided where all premature infants are segregated Here there is a large ward containing incubators and cots together with a small adjoining room with facilities for giving baths and treatment The temperature of the room is under automatic control at 80 F No attempt is made to regulate the humidity of the room Immediately after the infant has been born in the delivery room he is wrapped in a sterile heated blanket and carried as quickly as possible to the nursery All those weighing under 2 050 grammes (4½ lb) are placed in incubators beside which an oxygen cylinder is kept in case cyanosis develops Irrespective of weight at birth each infant is given breast milk which is supplied by his own mother when possible The records show that the longer the breast milk is kept up the lower the mortality even though the infants are only partly breast fed Among the 330 infants there was a mortality of 28·5 per cent—the smaller the infant the higher the mortality The mortality of those under 3½ lb was over 50 per cent The mortality among boys was greater than among girls A prominent factor in those that died was an injury sustained at birth, and only a small percentage of deaths were due to infection The smallest infants lost more weight in the first four days after birth than the heavier ones Prematurity and birth injury were found to be the most common cause of death in infants weighing under 3½ lb at birth while in the heavier infants infection was the most common

144 Gonococcal Arthritis in the Newborn

J P Garrahan and C Ruiz (*Sem méd* B Aires, December 10 1936 p 1620) record the case of a female infant who seven days after birth developed gonococcal conjunctivitis and a week later swelling of the left wrist followed by a similar swelling of the right The swellings subsided in twenty days and were accompanied by bony changes revealed radiologically which also cleared up spontaneously The mother was also suffering from gonococcal arthritis and vaginitis The writers emphasize the fact that during the first months of life a gonococcal infection however slight may give rise to lesions resembling those produced by congenital syphilis

145 Enlarged Tonsils and Intelligence

T Brander (*Finska Läksällsk Handl* November 1936, p 969) has examined at the University Children's Hospital at Helsingfors 373 children whose weight was 2 500 grammes or less at the time of their premature birth The ages of most of these children at the time of examination were between 7 and 15 years In 48 per cent the tonsils were enlarged They were classified according to the degree of enlargement and a comparison was made between it on the one hand and the school records and the results of intelligence tests on the other It was found that the various forms of mental backwardness increased in frequency with the degree of enlargement of the tonsils Conversely the proportion of mentally normal or gifted children diminished as the degree of enlargement of the tonsils increased There would therefore seem to be a definite connexion between the mental condition of these children and the enlargement of their tonsils but the author does not claim to have demonstrated that the former is due to the latter It is possible he thinks that both may be due to the same cause or that mental backwardness may promote hypertrophy of the tonsils If there is a common cause for both conditions this may be found in premature birth A distinction is drawn between school reports and the findings of intelligence tests and the suggestion is made that while the removal of enlarged tonsils may often improve a child's career in class and in the eyes of its teachers such treatment is not likely to have much effect on the intellectual functions of a mentally backward child as judged by the Binet Simon Terman tests

COMFORT IN BED *for* rheumatic *and* neuritic cases, *the* chronic invalid, *and the* aged

Those who have recently made the acquaintance of Viyella Sheets are warm in their praise From many parts of the country come letters telling of the comfort Viyella Sheets have brought to sufferers from rheumatic complaints to chronic invalids, the aged and others who dread the chill of linen or cotton sheets Many members of the Medical Profession have shown their confidence in Viyella Sheets by recommending them to their patients and have even gone so far as to write personal letters endorsing the claims that have been made Now when the resistance of those who suffer from chronic illness is lower the kindly comfort and sweet relief of Viyella Sheets will be doubly welcome

NATURAL WARMTH AND SOOTHING COMFORT

Viyella Sheets have the smooth touch of linen but the warm feel of wool They are porous and light as down being made of a scientific blending of purest Lambswool which radiates heat absorbs perspiration and is absolutely non irritant They bring the *natural* warmth and soothing comfort which induces sleep

If you have not already received detailed particulars of Viyella' Sheets we shall be pleased to send these together with samples of the fabric Inquiries should be addressed to William Hollins & Co Ltd (Medical Inquiries), Viyella House Nottingham

* EXTRACT FROM THE 'PRACTITIONER *

Most practitioners have patients—sufferers from rheumatism neuritis sciatica, nephritis pneumonia etc—whom they know would be much better off sleeping between blankets but the patients frequently dislike the irritation and the weight of the blankets In view of this we have been asked to make a test of Viyella Sheets as being the happy medium between the heavy blanket and the cold sheet There was no suggestion of weight or irritation and there was an unusual cosiness in getting into bed between Viyella Sheets The feeling of soothing and comfort which ensued ought to do good to invalids and convalescents

FIXED TRUST CERTIFICATES

146 Fractures in the Newborn

A THORNDIKE and F R PIERCE (*New Engl J Med*, November 26, 1936, p 1013) reviewed 6,000 fractures at the Children's Hospital, Boston, and found that many cases of previously unrecognized birth fractures were brought at the age of 1 year because of some deformity Bowing of one leg was common The old teaching that mere fixation is the only treatment required to produce good results is no longer considered satisfactory The authors feel that in the great majority of cases the obstetrician cannot be blamed for a fracture arising during the course of delivery It is pointed out that breech presentations are especially liable to cause fractures as well as other injuries In this series 113 consecutive cases of birth fracture are reviewed, and fifty-three fractures of the clavicle, thirty-eight of the humerus, twenty of the femur, and four of the tibia were found In most of these cases intervention for the delivery of a living baby had been necessary A large number of these fractures were not recognized at the time of birth, but the authors point out that this is often difficult Unrecognized and untreated fractures in the newborn heal very rapidly, so that it is impossible to alter the position of the fragments manually after five days Early diagnosis and efficient treatment are of utmost importance to ensure good results leaving no deformity in later life Reduction of these fractures does not involve the complicated manipulation necessary in older children A description of the fixation for each type of fracture is given, with illustrations Many cases of fracture of the clavicle heal well even though untreated, and are only recognized by a callus enlargement There was no case of intra-uterine fracture found in this series, and this type of fracture is regarded as rare In most cases in which fracture occurred the weight of the baby was above the average, and so caused more manipulative measures at birth

Obstetrics and Gynaecology

147 Induction of Labour

K EHRHARDT and E HENSS (*Med Klinik*, December 11, 1936, p 1700) summarize their experience with castor oil-quinine-hypophysin treatment, which was successful in 80 per cent of properly selected cases The treatment was carried out according to the following plan at 7 a m two tablespoonfuls of castor oil, at 8 a m 4 grains of quinine the same dose of quinine repeated again at 9 a m and 10 a m, at 11 a m an intramuscular injection of 0 2 to 0 3 c cm of hypophysin, the same dose of hypophysin repeated again at 12 noon, at 1 p m, and 2 p m Multiparae respond to the treatment better than primiparae In successful cases the duration of labour was shortened in primiparae The artificial induction of labour was particularly successful in cases where delivery has been overdue one to two weeks The proportion of forceps cases was not higher than in deliveries at term The proportion of uterine atony was 2 2 per cent This percentage is approximately the same as in spontaneous deliveries The castor oil–quinine–hypophysin treatment may facilitate the expulsion of a dead foetus or of a hydatid mole

148 Action of Insulin on the Uterus

E KLAFTEN (*Zbl Gynak* November 28, 1936, p 2834), who has previously reported that insulin causes in the isolated uterus of the guinea-pig an increase in strength and regularity of the spontaneous contractions, as well as considerably increased sensitiveness to applications of posterior pituitary extract, now finds that the same is true of the uterus of the mouse or rat The response is completely absent however in the rabbit's uterus (which also differs from that of the other animals in showing not a diminution but an increase of tonus on treatment with adrenaline, and in losing tonus in response to corpus luteum hormone) The insulin effects are given only by crystalline or dry preparations, not by the liquid solutions, which contain preservatives, they have also been obtained in virginal, gravid, and puerperal uteri *in situ* and would appear in the living animal to be obtained partly through the ovary as intermediary The minimum uterotonic dose is one quarter unit Concerning clinical applications of insulin treatment Klaften speaks hopefully, he recommends it for certain cases of dysmenorrhoea, polyhypermenorrhoea, and metropathia haemorrhagica, and for uterine haemorrhage reports an early therapeutic effect from the direct uterotonic action of insulin on the myometrium For metrostasis twenty units of insulin are injected mixed with 10 c cm of 10 to 20 per cent calcium gluconate

Pathology

149 Gonococcal Complement-Fixation Test

GERDA KJELLBERG (*Nord med Tidskr* December 12, 1936, p 2030) points out that one important reason for the campaign against gonorrhoea being less effective than that against syphilis is that the former presents comparatively great difficulty in discovering sources of infection She asks if this difficulty may be overcome by the application of the complement-fixation test to persons suspected of being sources of infection or involved in mutual accusations of infection She has applied this test to 464 persons accused of conveying gonorrhoea and attending the St Goran's venereal disease polyclinic in Stockholm There were 138 males and 326 females in this group, and they were examined between May, 1933 and September, 1935 Three of the persons concerned were each accused of transmitting gonorrhoea on two occasions and the sum total of examinations was therefore raised from 464 to 467 In as many as 379 of these 467 examinations the complement-fixation test was negative, being so in 109 male and 270 female cases There were also several cases in which the fixation was only partial or faintly positive, and the number of cases in which it was definitely positive was only twenty eight Hence the author's conclusion that there is little to be expected of the complement-fixation test in gonorrhoea as a means whereby the discovery of sources of infection can be promoted

150 Blood Platelet Disintegration

I OLEF (*J Lab clin Med* November, 1936, p 128) describes methods for simultaneous total and differential platelet counts and determination of the rate of disintegration of platelets that he has applied to normals and in various diseases In 85 per cent of twenty six normals 11 to 60 per cent of the platelets disintegrated in eight hours Abnormal stability of the platelets occurred when less than 10 per cent disintegrated in eight hours, abnormal fragility (over 60 per cent disintegration) was infrequent The differential platelet formula underwent changes during disintegration of the platelets, the large platelets undergoing disintegration first In many chronic conditions—anaemia, haemophilia, polycythaemia malignancy, etc—the fragility of the platelets was normal and uninfluenced by the total platelet level and the differential platelet formula Changes in total platelet count were usually associated with changes in fragility and differential formula In thrombopenic states fragility decreased as the total count rose to normal, in thrombocytosis fragility increased as the platelet count rose and decreased as normal platelet level was reached Abnormal stability of the platelets was found in thrombopenias as in scurvy, nephrosclerosis, etc, and was frequently associated with spontaneous haemorrhages Increased stability, reduction in total count and changes in differential formula followed roentgen-ray irradiation

A Private Home for the Care and Treatment of a limited number of Ladies and Gentlemen suffering from Mental and Nervous Disorders Certified Voluntary and Temporary Patients received Large house with 12 acres of grounds (See *Medical Directory* p 2312) Apply Physician *Telephone* Tulse Hill 7181

tain pathological material was subjected to re-aspiration six months later such a period being allowed for spontaneous recovery or that due to removal of the tonsils and adenoids Such re-examination showed that in only nine out of the twenty four children were the antra then clear of pathological material In other words 15 per cent of children being operated upon for removal of the tonsils and adenoids had chronically diseased antra This is a startling fact which may go far to explain the trying group of "failures" after tonsillectomy in which symptoms of respiratory tract infection and other disorders recur despite efficient removal of obviously diseased lymphoid tissue in the naso-pharynx

The second group of seventy six children in Mr Crooks's analysis were collected upon a clinical basis as presenting the signs and symptoms including x ray evidence of antral disease The average age of these children was 7½ years and thirty-seven of them could be classified as cured after treatment This consisted of antral lavage (with an average number of washes between two and three) in all but two children in whom intranasal antrostomy was necessary Twenty six of the remainder were improved after treatment and thirteen failed to show improvement Mr Crooks discusses these successes and failures in some detail, emphasizing that local measures must be supplemented by general measures such as a good diet and a stay at the seaside The clinical manifestations of sinus disease have been analysed for the 100 children in the two groups and these may be listed as follows (with the percentage incidence indicated in brackets) nasal discharge (84), colds (83) cough (82) snoring and mouth breathing (62) headache (44), otitis media (44), cervical adenitis (37), sore throat (25), together with a less well defined group of systemic manifestations resulting in a pale tired child with difficulty in concentration, loss of interest in work and play, and a change of temperament towards a morose ill tempered disposition This last is of great interest in view of the claims made for the frequency of sinus infection in certain mental disorders Discussing the relation between sinusitis and infection of the tonsils and adenoids, Mr Crooks affirms his belief that sinusitis is a common cause of inflammation of the adenoids and to a lesser degree of the tonsils Certainly he appears to have proved conclusively that removal of the tonsils and adenoids alone will not cure infected sinuses, and he regards such an operation as of secondary importance to treatment of the sinusitis itself

Many other problems are dealt with by Mr Crooks which cannot be extensively discussed here The bacteriological aspects of the subject for example, are treated at some length Routine swabs were taken from the nose in the 100 children undergoing routine removal of tonsils and adenoids and the results of bacteriological examination (carried out by Dr A Signy) were compared with bacteriological investigation of the contents of the 200 antra aspirated in this part of the work A notable difference was discovered since the staphylococcus was often present in the nose but rarely in the antrum and the same applied to the *Micrococcus catarrhalis* The streptococcus was often found in the nose, and was the cause of antral infection in a number of cases The pneumococcus was the most frequent cause of antral infection but was less frequently found in the nose It was characterized by thick yellow green pus usually present in large quantity Another important point can be mentioned in conclusion—namely diagnosis Mr Crooks claims that x ray examination is the most sensitive of all the diagnostic tests for sinusitis Transillumination is not so accurate and presents several fallacies Puncture aspiration (the technique of which is described in detail) affords an absolute proof of antral infection and therapeutic lavage can be carried out at the same time Mr Crooks is to be congratulated on a study full of interest for all those concerned with the health of the child

ASTHMA RESEARCH

The latest annual report of progress of the Asthma Research Council states that this body is continuing its policy of using funds received from the general public for the remuneration of qualified workers who publish their results in the medical press The Medical Advisory Committee keeps itself informed concerning investigations in asthma at home and abroad and the programme of research is arranged accordingly Reports are appended recording the year's work at several asthma clinics The policy at Guy's Hospital has been the most thorough and careful study of small groups of cases representing the product of ruthless exclusion and elimination Following a report that asthma in the Channel Islands was frequently associated with bronchiolar infection by monilia and often improved by treatment with the appropriate vaccine Dr F A Knott studied the prevalence of monilia infections in asthma patients in London The incidence of such infection in London asthmatics was found to be extremely low and no evidence of specific cutaneous hypersensitivity to monilia was obtained Dr Rogerson investigating asthmatic children from the psychological standpoint found that their intelligence was above the general level he also noted such features in personality as over anxiety and fear of failure With regard to the effect of psychological factors in facilitating or inhibiting the allergic antigen thought to be responsible for an attack he noted in many cases a latent period of about one hour between

the psychological stimulus and the attack At King's College Hospital interest has been concentrated on the value of remedial breathing exercises, and cases have been followed up over a period of four years In cases so treated it is the improvement in the reserve air rather than the total vital capacity that is of chief importance To achieve this improvement proper control of diaphragmatic breathing is considered essential At St Mary's Hospital the special hay fever clinic, which functions from March to July each year, has promoted the principle of self-inoculation with satisfactory results in the majority of cases The demand for pollen continues to grow, and special reference is made to the work of Miss Noon, who collected during the season over 31 lb of various grass pollens in addition to a large amount from rye and maize In experiments at King s College the liberation of potassium observed in the intact animal after injection of adrenaline has now been demonstrated in the isolated liver A quantitative relationship is shown between the amount of adrenaline injected and the amount of potassium liberated It is thought that these observations may provide corroborative evidence of Professor Burn's view that the circulating blood of asthmatics contains a deficiency of adrenaline Copies of the report are obtainable free from the secretary of the Asthma Research Council, c/o King's College, Strand, W C 2 The council also publishes an illustrated pamphlet, *Physical Exercises for Asthma*, price 2s , post free

SCARLET FEVER AT DONCASTER

An epidemic of scarlet fever in the county borough of Doncaster began on December 11th, and up to date 186 cases have been notified, with three deaths—one in a child aged 2 and two in women aged 38 and 48 respectively The source of the epidemic has been traced to an infected milk supply, 148 cases and two of the deaths being directly associated with this supply, and illustrates once more the danger to the public of drinking milk which has been neither boiled nor pasteurized For the following information we are indebted to Dr Ralph Watson medical officer of health for the county borough of Doncaster, and to Dr Penman, medical officer of health for Doncaster rural district On December 11th a child whose father was a dairyman was notified as a suspected case of scarlet fever The dairyman called at the Public Health Office and gave the information that several of his customers were suffering from sore throats and that some had rashes A house-to-house inquiry of the dairyman's customers subsequently showed that at least 100 persons had been suffering from tonsillitis of varying degrees of severity On the same date (December 11th) seventeen further notifications of scarlet fever were received It was discovered that the milk which had been supplied to the infected houses had in every case been obtained from one farm the supply from which was immediately stopped pending further investigations A visit to the farm revealed that one of the milkers had been suffering for a fortnight from a sore throat from swabs of which cultures of haemolytic streptococci were grown It was further found that one of the milker's children had had a running ear for over a fortnight, and haemolytic streptococci were isolated from the aural discharge The child had been attending a school in which there were cases of scarlet fever towards the latter end of November, but she herself had never had a rash Examination of samples of milk between December 11th and 14th did not disclose the presence of haemolytic streptococci Instructions were issued on December 12th to all consumers to boil their milk, and arrangements for pasteurization were completed on December 16th Approximately 60 per cent of those infected were children, and about 70 per cent of those suffering from clinical scarlet fever were moved to hospital It would appear that in the majority of cases the onset occurred on the 10th, 11th, and 12th of December, there was a marked fall on the 13th, a further small rise on the 15th, 16th, and 17th, after which cases rapidly decreased

LIFE WITHOUT BACTERIA

What part do bacteria play in the economy of the host? This question, which numerous observers have tried to answer, is of far-reaching importance One way of approaching the problem is to find out whether it is possible to rear animals under conditions of complete asepsis This has been done to a limited extent, and enough data have been collected to show that insects and certain cold-blooded animals can live and grow in the absence of bacteria Mammals present a more difficult problem, and credit must be given to Nuttall and Thierfelder in 1895–6 for being the first to succeed in rearing a guinea-pig for eight days under sterile conditions Success in this direction was also recorded by Cohendy and Wollman and by Kuster in 1912 Since then little has been done The problem, however, has now been taken up afresh in Sweden, where Dr Gosta Glimstedt[1] of the University of Lund has carried out a very thorough and painstaking investigation into the growth and mortality of guinea-pigs reared under aseptic conditions The animals were removed by Caesarean section and reared in an apparatus so constructed as to exclude the access of bacteria They were not allowed, of course, to suckle their mothers, but were put immediately on to a carefully balanced diet which had been sterilized by heating in the autoclave on three successive days To compensate for the destruction of vitamins, cod-liver oil, yeast extract, and lemon juice all sterilized by filtration, were added A number of animals were raised under these conditions, and among them three were reared for twenty-eight days, two for thirty-two days, and three for as long as sixty days Compared with animals that were fed on a similar sterilized diet but not maintained in a bacteria-free environment the animals in the "sterile" group showed approximately the same mortality within the period of observation, but their increase in weight appeared to be rather less Histological examination revealed a comparative failure of development of the lymphoid tissue, particularly of the glands normally

Printed and published by the British Medical Association at their Office Tavistock Square, in the Parish of St Pancras, in the County of London Printed in Great Britain Entered as Second Class at the New York U S A, Post Office

draining the respiratory and intestinal tracts Taken in conjunction with the loose unformed nature of the stools and the small size of the thymus the author concludes that the animals must have suffered from a moderate degree of nutritional disturbance The poor development of the lymphatic glands is referred to the absence of bacteria which under normal conditions appear to be largely responsible for stimulating the development of lymphatic tissue The author is guarded in his general conclusions but there seems little doubt that though bacteria are not essential for life and growth their presence particularly in the intestinal canal is favourable to the nutrition and development of the host In conclusion the attention of laboratory workers may be drawn to the interesting data recorded in this monograph on the effect of dietetic seasonal and other factors on the growth and mortality of normal guinea pigs

CAFFEINE INTOXICATION

Every adult in these islands consumes on an average about 6 grains of caffeine a day and it is somewhat remarkable that cases of caffeine intoxication are rarely encountered There are few other drugs with a well-marked pharmacological action which could be taken with equal impunity in full therapeutic doses every day by nearly the whole population Cases of caffeine intoxication due to chronic over indulgence in tea or coffee do however occasionally occur Powers[1] stated that he had observed thirty six cases and that the commonest symptoms were vertigo headache and nervousness visual disturbances and insomnia were rarer McManamy and Schube[2] describe a case in which acute intoxication was produced in a woman who took 60 grains of caffeine citrate in tablet form She became delirious and was removed to hospital and a few weeks after discharge she again took another huge dose of caffeine (75 grains) from which she also recovered The patient in addition to being highly emotional was also hypersensitive to many drugs and to proteins The fact that a person could take two huge overdoses of caffeine within a month without suffering permanent injury is noteworthy for it provides further evidence of the low toxicity of this drug

CHRONIC CO POISONING

The signs and symptoms of acute poisoning by carbon monoxide are well known but much less is known of the dangers of chronic intoxication by this gas According to H G Beck[3] there is a definite clinical entity which can be recognized in patients who have been repeatedly subjected to sublethal doses of carbon monoxide at varying intervals over prolonged periods Based on a series of nearly a hundred patients Beck puts forward a somewhat complicated clinical picture The source of the carbon monoxide was natural gas illuminating gas motor car exhaust and blast furnace fumes in that order of importance The chief complaints were headache giddiness nervousness muscular pains digestive disturbances dyspnoea and palpitation The headache was usually of a dull character felt in the frontal region and sometimes throbbing One third of the patients complained of weakness and unsteadiness in the legs several having completely lost the use of these limbs Feelings of depression restlessness anxiety and fears were common as was also vaso motor instability manifesting itself in morbid flushing local sweating cold extremities and purplish congestion of the hands and feet. Muscular pains felt in the back shoulders abdomen or chest or even generalized throughout the body were common Among the digestive symptoms difficulty in swallowing loss of appetite and constipation were the usual manifestations The symptoms arise predominantly from organs rich in blood supply and appear to be due to a mild but definite degree of oxygen deprivation Beck summarizes the existing pathological investigations which support this view Usually the red cell count and the haemoglobin estimations are above normal and there was clinically a tendency towards slowing of the pulse and lowering of the blood pressure Once symptoms have developed they are very difficult to get rid of suggesting that organic changes may rapidly occur when organs such as the heart or brain are kept chronically starved of oxygen It follows that proper preventive measures are of great importance and the solution of the problem is largely one for engineers

OESTROGENIC HORMONES AND THE NASAL MUCOSA

During the last twenty years or so the question of a naso genital relationship has been rather neglected but before this period the problem received a good deal of attention mainly on the clinical side without much light being thrown on the subject In an illuminating paper on carefully controlled observations on monkeys Drs H Mortimer R Percy Wright and Professor J B Collip[1] now revive this question Their interest was first aroused by finding evidence of dyspituitarism in a family of nine children and both parents all of whom suffered from atrophic rhinitis and later in 80 per cent of a moderately large series of cases of atrophic rhinitis From these clinical observations they concluded that the constitutional factor in this disease may be related to pituitary function and in view of the possibility that the anterior pituitary may exert an influence on the nose either directly or indirectly through the gonads by virtue of its gonadotropic hormone they have investigated first the effect of crystalline oestrogenic hormones on the monkey's nasal mucosa Throughout the experiment independent examinations of the nasal mucosa by means of a nasal speculum were made weekly by one group of observers and the condition of the sex skin face nipples and back and the presence or absence of vaginal bleeding were recorded independently by a second group all observers being ignorant of the treatment each animal was receiving Examination of a control group of twelve untreated immature and adult female monkeys over a period of

[2] *New Engl J Med* 19 6 215 616
[3] *J Amer med Ass* September 26th 1936 p 1025

[1] *Canad med Ass J* November 19 6 p 503

several months revealed that there is a coincident increase in the degree of colour of the nasal mucosa and of activity in the sex-skin areas at intervals of about twenty-eight days, and that the peaks of nasal activity are chiefly premenstrual in time It was found that such "nasal peaks" were 8 per cent more regular as a manifestation of sexual activity than uterine bleeding, and that they were most marked in September and October, when conception is most likely to take place, and least in January and February Fourteen immature and adult monkeys, three of which were males and four castrated females, were treated daily with varying doses of oestrogenic hormones (oestrone, oestriol, and emmenin) Positive responses, characterized by marked reddening of the nasal mucosa, were obtained after seven days in males and females, immature and castrated as well as adults, and there was an increase in the reaction after a further week's treatment These changes were synchronous with those known to occur in the nipple, sex-skin, face, and back, and appeared to be definitely a specific response The best responses were obtained in adolescent animals that had been previously untreated Very immature animals did not respond so well, and in animals which had been mature for some considerable time the changes may have been masked by spontaneous coloration Responses were not obtained in castrated females with pituitary gonadotropic hormone, but no mention is made of its effect in the intact animal These experiments may open up a new field in the treatment with sex hormones of certain pathological conditions of the nose, and the subject is worthy of further investigation on clinical and experimental lines

RHEUMATIC FEVER AND VITAMIN C DEFICIENCY

Since our last comment on the subject[1] still greater interest has been taken in the relation of vitamin C deficiency to rheumatic fever and to infections in general, an exhaustive review[2] of the present status of the clinical use of crystalline vitamin C (ascorbic or cevitamic acid) has been made by Irving Wright The lowered urinary excretion of ascorbic acid recently reported by Abbasy, Gray Hill, and Harris[3] in rheumatic fever has been observed in a wide variety of infective conditions and is probably an index of an augmented metabolism of, and hence a greater requirement for, vitamin C on the part of the body But the evidence that vitamin C subnutrition is an aetiological factor in rheumatic fever is no more firm than it was On the experimental side the identity of the heart lesions described in animals by Rinehart and his colleagues with those of human rheumatic fever has still to be established On the clinical side Sendroy and Schulz at the Rockefeller Hospital remain unconvinced that either saturation tests or the results of treatment indicate any specific relation between vitamin C and rheumatic fever Wright and his colleagues have been unable to affect the course of rheumatic fever cycles even by massive doses of vitamin C Warner and Winterton[4] have added another careful argument to the belief that subnutrition is a factor in the aetiology of rheumatic fever, but they found no evidence that vitamin C deficiency is specific Abbasy, Gray Hill, and Harris are impressed by the fact that the low excretion of vitamin C continues even in convalescence in the case of rheumatic fever, whereas in surgical tuberculosis the urinary excretion returned to normal during convalescence But the balance of evidence at present is against the view that vitamin C deficiency is an aetiological factor in rheumatic fever A warning note has been sounded by Irving Wright on the rapidity with which ascorbic acid disappears when urine is allowed to stand He found a loss of 30 per cent in four hours even in the presence of glacial acetic acid

SAMUEL JOHNSON AND JOHN HUNTER

The interesting literary method of "the dialogues of the dead," employed by Lucian in the second century A D, by Fontenelle and by William King in the seventeenth century, George "the good" Lord Lyttelton in the eighteenth century, and by H D Traill in the nineteenth century, has seldom been employed in connexion with medical history Attention may therefore be directed to an example of how successfully this can be done—namely, "A Meeting Which Never Took Place A Play in Half an Act," by Dr William B Howell[1] of Montreal, who wrote a volume on *Canadian Medicine* in the Clio Medica Series It is remarkable that the two great men—Samuel Johnson, who had so many medical attendants and friends, and John Hunter—never met The scene in Dr Howell's *jeu d esprit* opens in the White Hart Tavern, Borough, on a December evening about 1780 Johnson has fallen asleep over a copy of the *Natural History of the Human Teeth* by Hunter, who, coming in, salutes the stranger, and picking up the volume which had dropped on the floor turns the conversation on to the subject-matter Johnson, probably antagonized by Hunter's accent, dismisses it as a dull book on a dull subject, and refers to the author as a well-known surgeon, reputed to be an honest enough man, though an ignorant one They then disagree about the value of the classical languages and education, Johnson criticizes the Scots and says of Hunter that "he is a dirty fellow he stinks," and the other becomes so angry that he has an anginoid attack, Johnson gives first aid and Hunter, recovering, thanks him quotes from Johnson's *Vanity of Human Wishes* with approval and after some further sparring they reveal their identity to each Curtain

THE PATRON OF THE B M A

The Keeper of the Privy Purse is commanded by the King to state that His Majesty is pleased to intimate to those societies and institutions which were recently granted patronage by King Edward VIII that they may continue to show the Sovereign as their Patron during the present reign unless otherwise notified

You're Wrong

You can argue as much as you like about the dynamo being specially regulated to balance the battery output The fact remains that the car wouldn't start, would it? Moreover, everything pointed to a run-down battery You need a Westric to ensure a quick start during winter Just plug in overnight and it will do its work while you sleep

Easy starting saves time—and batteries, while good lighting may save your neck

WESTRIC

Post-Influenzal Debility . . . . .

IN OUR RECORD OF CASES IN WHICH NUMOL HAS FORMED PART OF THE PRESCRIBED TREATMENT, THOSE CONCERNING INFLUENZA ARE BY NO MEANS THE LEAST IMPORTANT AND DOCTORS HAVE FOUND IT ESPECIALLY VALUABLE WHERE THE ILLNESS HAS BEEN ACCOMPANIED BY SOME FORM OF GASTRIC DISTURBANCE AS AN AID TO RECUPERATION IN POST-INFLUENZAL DEBILITY IT HAS A VERY DEFINITE VALUE

CHILDREN LOVE NUMOL

The following are extracts from two doctors' letters on the subject

(1) "I have been prescribing NUMOL very freely for my patients after Influenza with most beneficial results"

(2) "I have confidence in NUMOL because I find it better than you say and there is no exaggeration in your claim"

Doctors who have not already prescribed NUMOL are asked to send a post-card for free sample.

THE FOOD OF HEALTH

NUMOL LIMITED - NEWCASTLE-ON-TYNE

COMFORT IN BED *for* rheumatic *and* neuritic cases, *the* chronic invalid, *and the* aged

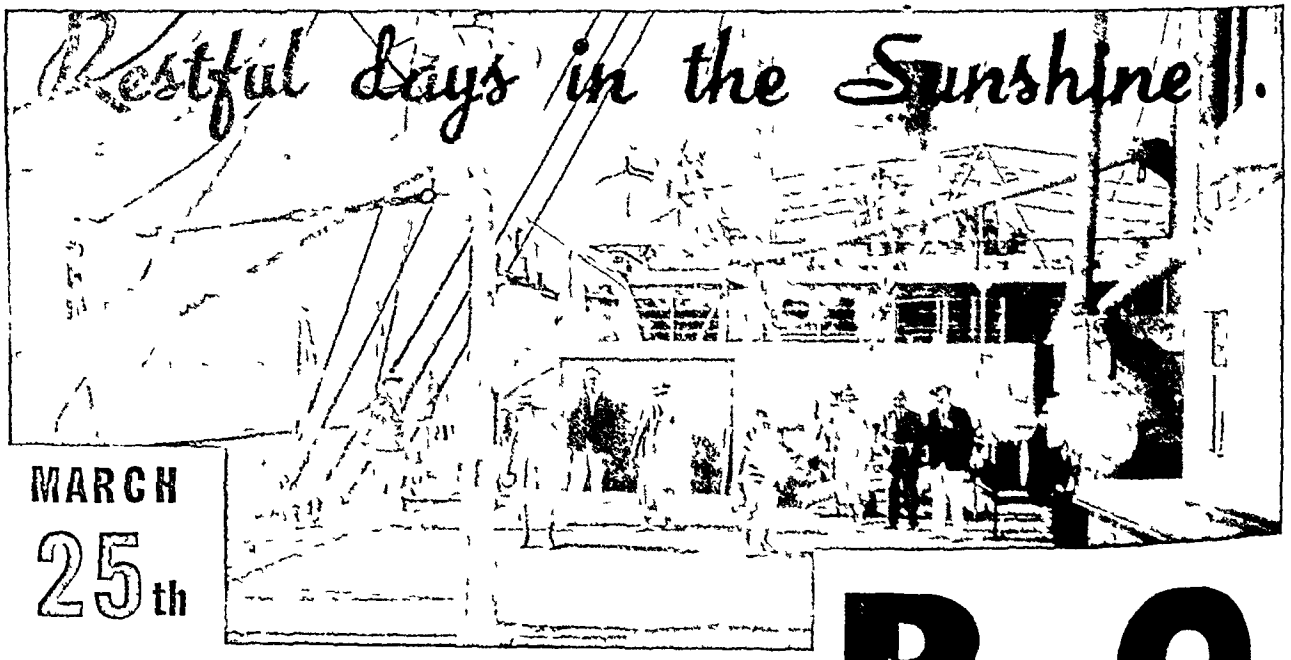
Those who have recently made the acquaintance of 'Viyella' Sheets are warm in their praise From many parts of the country come letters telling of the comfort 'Viyella' Sheets have brought to sufferers from rheumatic complaints, to chronic invalids, the aged, and others who dread the chill of linen or cotton sheets Many members of the Medical Profession have shown their confidence in 'Viyella' Sheets by recommending them to their patients, and have even gone so far as to write personal letters endorsing the claims that have been made Now, when the resistance of those who suffer from chronic illness is lower, the 'kindly comfort and sweet relief' of 'Viyella' Sheets will be doubly welcome

NATURAL WARMTH AND SOOTHING COMFORT

'Viyella' Sheets have the smooth touch of linen but the warm feel of wool They are porous and light as down, being made of a scientific blending of purest lambswool which radiates heat absorbs perspiration, and is absolutely non irritant They bring the *natural* warmth and soothing comfort which induces sleep

If you have not already received detailed particulars of 'Viyella' Sheets we shall be pleased to send these, together with samples of the fabric Inquiries should be addressed to William Hollins & Co Ltd (Medical Inquiries), Viyella House, Nottingham

* EXTRACT FROM THE 'PRACTITIONER' *



Most practitioners have patients—sufferers from rheumatism, neuritis, sciatica, nephritis, pneumonia etc—whom they know would be much better off sleeping between blankets, but the patients frequently dislike the irritation and the weight of the blankets In view of this, I have been asked to make a test of 'Viyella' Sheets as being the happy medium between the heavy blanket and the cold sheet There was no suggestion of weight or irritation, and there was an unusual cosiness in getting into bed between 'Viyella' Sheets The feeling of soothing and comfort which ensued ought to do good to invalids and convalescents

Now the filter tip is cork or plain.

du MAURIER Medium, in the blue box . . . for those smokers who prefer a medium cigarette.

The filter tip is made from a five layered material composed of three layers of pure white vegetable tissue interleaved by two layers of cellulose fibres

Choice of plain or cork tip is a matter of personal preference So is the choice of a mild or medium cigarette ¶ The new "du Maurier" (easily recognised by the blue box) gives to habitual "medium" smokers a plain tip cigarette with all the advantages of the familiar "du Maurier" filter Only the pure smoke of finest Virginia tobacco passes the lips—no bits in the mouth

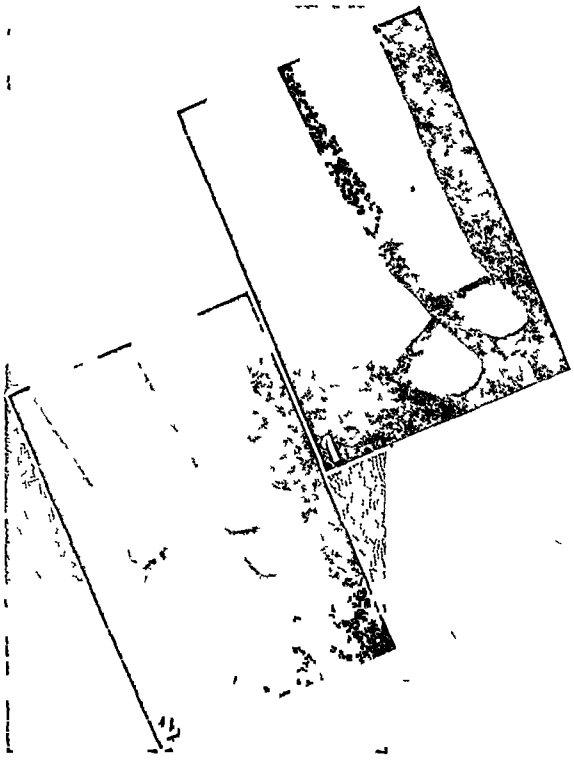
In these pages

you will find advertised many of the things which supply your three needs



The therapeutic preparations surgical requisites and apparatus for physical treatment which are the basis of your professional requirements form, with books, the subject matter of the majority of B M J advertisements Every effort is made by the B M A to ensure that readers may deal with confidence with those firms whose advertisements are accepted for the Journal

Many valuable food preparations are recommended by the profession for the use of patients needing special nourishment and particularly those suffering from vitamin deficiency Scientifically prepared infant foods claim the attention of both mother and doctor Logical "reasons why" are often stated in the advertisements in the B M J which firms of repute wishing to earn professional goodwill regularly insert in the Journal of the B M A

In your leisure moments you are aware of the pleasure to be obtained from a good radio, a pipe or cigarette A run through the countryside in your car is another relaxation if the day has been spent indoors Here the advertisements in your B M J help to supply the needs of pleasure In the choice of a car professional necessity will weigh as heavily as private needs These advertisements accordingly deserve special attention

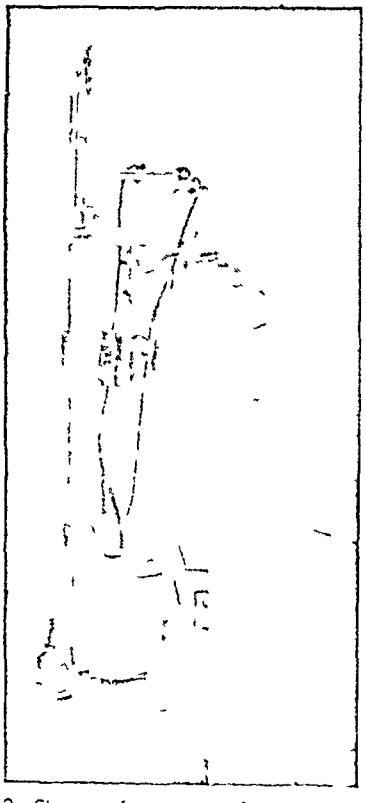
1 Varicose ulcers of long standing



For VARICOSE ULCERS—

You know the condition Its victims haunt clinics and consulting rooms seeking the relief which years of ineffectual treatment may fail to give them

The British Medical Journal of January 2, 1937, tells how 92 cases had attended a clinic twice weekly for over three years 72 5% of these were discharged cured within three months after the treatment was changed to applications of ultra-violet rays from the quartz lamp, administered once weekly with suitable combination technique

It is quite within your power to obtain similar results on your own patients For a moderate outlay, or by purchase out of income, you can install the most modern type of standard actinotherapy lamp

Write for professional literature (or post the coupon)

2 Clear up after a course of actino herapy

The Hanovia DUO-THERAPY UNIT

Actinotherapy — treatment by ultra violet and the associated radiations— is "the most vitalizing of all tonic measures," and a specific treatment in many common disorders It is essential in every form of medical practice

You are invited to make free use of the special service for information on actinotherapy and for supply of equipment which we extend through expert agents in every medical centre of Britain and in the Overseas Dominions

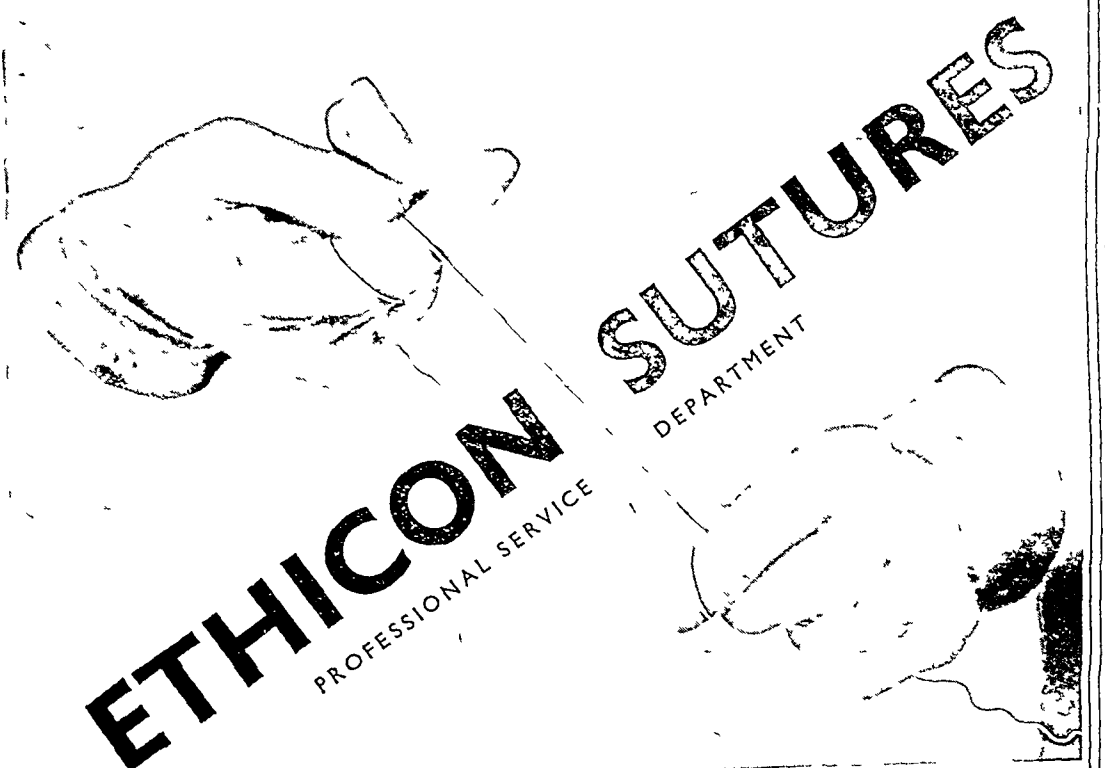
Why so many Surgeons insist on ETHICON SUTURES



★ Ethicon Sutures are rendered exceptionally pliable by a new process

★ Ethicon Sutures are unusually strong

★ Ethicon Sutures are smooth

★ Ethicon Sutures are uniform in calibre

★ Ethicon Sutures are Heat Sterilised

Every batch of Ethicon Sutures is rigidly tested for sterility in accordance with the Therapeutic Substances Act

Supplied in Sizes 000 00 0 1 2 3 4 & 5
Plain medium hard chromic extra hard chromic

NO 'DIASTATIC' ACTION

Partial Cooking Destroys Rancidity . . .

Analysis shows that HOVIS has the advantage over white bread in being richer in salts It contains, in addition, more edible fats and a higher percentage of protein than either white or wholemeal bread After mechanical separation from the bran and endosperm, the purified entgerm which gives HOVIS its added nutrition is subjected to the action of superheated steam This partially cooks the germ and entirely destroys the 'diastatic' properties which cause rancidity

more nutrition
greater digestibility

We Suggest that You Recommend THE ORIGINAL PINEAPPLE JUICE FROM HAWAII

THIS appetising fruit juice from Hawaii offers a sparkling change from routine fruit juice menus Children especially like it Because it is assimilated so easily it is ideal for babies That is why, when your patients ask your advice about fruit juices, we suggest that you recommend Dole—the *original* Hawaiian pineapple juice Thus delicious, golden juice is sealed in tins by the exclusive Dole Fast Seal Vacuum-Packing Process That is why Dole Pineapple Juice retains, in high degree, the fresh fruit constituents of ripe pineapple, as well as the fragrant, field fresh flavour Also it is a natural source of vitamins A, B, & C J K Husband & Co , Ltd , 10 Eastcheap, London, E C 3

Here is a typical Analysis of Dole Pineapple Juice

Moisture	85 3%
Ash	0 4
Fat (ether extract)	0 3
Protein (N × 6 25)	0 3
Crude fibre	0 02
Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12 1
Carbohydrates other than sugars (by difference)	0 38

THE SURF RIDER—Surfing, the sport of Hawaiian kings in olden days, was one of the favourite pastimes Owing to the way the surf breaks on the reef, Waikiki is the only place in the world where this sport is indulged in under ideal conditions

It is a marvellous sight to see the upright gleaming brown bodies of the native surfers come riding swiftly shoreward on a giant comber

P.S. Just write to us on your letterhead and we will be pleased to send you free a sample tin of delicious Dole Hawaiian Pineapple Juice

A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals, we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme trepsin, making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided

2 The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

★ ★ ★

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

VICHY-CÉLESTINS

THE WORLD RENOWNED NATURAL MINERAL WATER

FERMENTATIVE DYSPEPSIA

When the secretion is vitiated in quality and the motricity of the stomach weakens that organ dilates and the gastric stagnation allows the micro organisms of many ferments to develop Quite a series of acids are then to be met with (butyric lactic acetic etc) which not only irritate the mucosa but further after their passage into the intestine become absorbed by the lymphatics and swept into the circulation **Vichy-Célestins,** by its slightly stimulating action clears out the stomach and thus avoids stagnation and consequent fermentation As in addition to doing this it modifies stomachal metabolism the secretions return little by little to their normal physiological condition

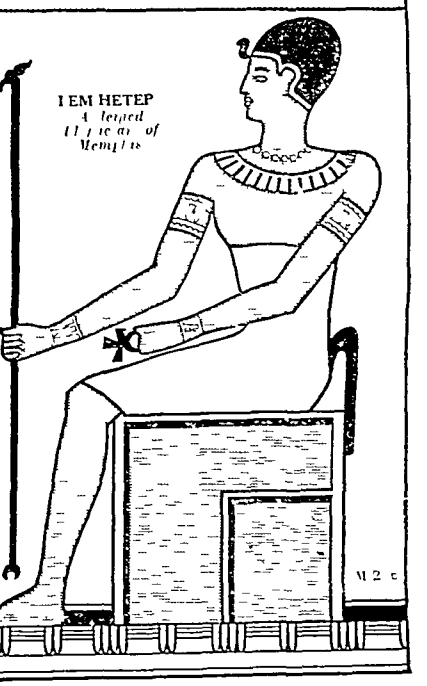
OVALTINE

IN PREGNANCY



THE physiological drain of calcium phosphorus vitamins and other important food elements calls for replacement during pregnancy Composed of milk eggs and malt Ovaltine supplies these essentials in a delightful form which does not overtax the unstable maternal digestion A cup of Ovaltine on arising during the early months is often effective in controlling sickness and has a food value greater than three eggs

IN LACTATION

To maintain lactation to the eighth month is an ideal not often realised under modern conditions of life Ample evidence is available to show that Ovaltine has a definite action in increasing the flow and enriching the quality of the milk It has moreover a beneficial effect on the health of mother and child The flavour is so agreeable that it can be taken for prolonged periods without any distaste arising

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE PROBLEM OF ENDEMIC GOITRE

BY

SIR ROBERT McCARRISON, C.I.E., M.D.

D.Sc., LL.D., F.R.C.P., MAJOR-GENERAL I.M.S. (ret.)

There are two types of endemic goitre, with many transitional forms between them, differing in their histological features, in their distribution, and in the constitutional states produced by or associated with them. It can hardly be doubted, so marked are these differences, that the two types differ also in their aetiology.

Two Types of Endemic Goitre

The first is the classical type prevalent in mountainous regions such as the Alps and Himalayas, occurring as a colloid poor diffuse *parenchymatous goitre* in childhood and as an *adeno-parenchymatous* nodular goitre with its degenerative forms in adults. The second is the *diffuse colloid goitre* prevalent in lowland regions such as the plains of Central Europe, and in England. The geographical limits of these two types are not clearly defined. Both may occur together in the same locality, but in general the former predominates in mountainous and the latter in lowland regions. The former is rarely associated with hyperthyroidism or Graves's disease; the latter is commonly associated with both. The former is usually associated with congenital goitre, cretinism, deaf-mutism and various grades of physical and mental deterioration; the latter is rarely associated with these congenital manifestations of the disease. The former in its adeno-parenchymatous form, increases in incidence as age advances, attaining to its acme between the ages of 50 and 60 years; the latter is more prevalent about the age of puberty, lessening rapidly or gradually disappearing after the age of 25 to 30 years. Both vary greatly in incidence in different localities. In regions of high endemicity the two sexes are affected in approximately equal proportions. In regions of low endemicity the incidence is higher in females.

The Parenchymatous Type

The parenchymatous type is a true hypertrophy of the gland; hence the name *chronic hypertrophic goitre* by which it is sometimes known. In this state of sustained hypertrophy the excretion of the gland's hormone tends to predominate over the secretion and storage of colloid, hyperplasia is pronounced, and many new vesicles are formed. Overstrain or it may be toxic action on the gland itself, ultimately leads to fibrosis with the appearance in the organ of circumscribed areas of more or less solid glandular tissue (adenomata) or of colloid containing follicles (colloid adenomata) or of both. The gland is constantly straining to satisfy the needs of the tissues for its hormone but just falling short of doing so; consequently evidence of hypothyroidism is often to be seen in sufferers from this type of goitre; hyperthyroidism rarely or never. In the pregnant female this sequence of events may result in failure of the maternal thyroid adequately to satisfy the needs of her own tissues and those of the developing foetus for the gland's products, especially when some additional burden (fright, worry, acute infections, or intestinal toxaemia) is placed on its resources. As a result the foetal thyroid is unduly stimulated and congenital goitre may arise in the offspring. Or the developing gland may be destroyed by overstrain and/or toxic action, with the production of cretinism. Such toxic action may be due to some unknown toxin or to poisons absorbed from the maternal intestine as in the experimental production of cretinism (*vide infra*) by the oral administration throughout pregnancy of a watery extract of faecal material. The congenital manifestations of adeno-parenchymatous goitre are as much a feature of the endemic as the goitre itself.

Diffuse Colloid Type

The diffuse colloid type is one in which the whole gland is made up of follicles of diverse shapes and sizes distended with and distorted by the accumulation of colloid within them. These follicles are lined with flattened epithelium and evidence of antecedent epithelial hypertrophy and hyperplasia may or may not be present usually it is. In normal circumstances the secretion of colloid with its storage in the follicles and the excretion of the gland's hormone—elaborated by special cells from the stored colloid—proceed in balanced adjustment one with the other. In diffuse colloid goitre some influence is at work which causes the former process to predominate over or to outstrip the latter. Following a period of hyperplasia and its cessation colloid may accumulate in the gland in large amount. This is the usual explanation of the diffuse colloid goitre but it is not wholly satisfying. It presupposes alternating periods of iodine want and iodine supply—iodine being the outstanding substance which increases colloid storage. It appears probable that other factors may be concerned in causing the undue accumulation of colloid. One of these seems to be the excessive ingestion of calcium relative to iodine and or phosphates which has been shown to cause such accumulation in animals. The recent investigations of Stott (1933, 1934) and his collaborators in the United Provinces of India, where diffuse colloid goitre prevails, have again brought into prominence the importance of lime as a goitrogenic factor in that locality, if not in others.

Colloid tends to accumulate in the gland when there is a deficiency of vitamin C in the diet and this accumulation may result in the production of small goitres. In this condition the gland exhibits a *tendency to diminution* in alkalinity, suggesting that the accumulation of colloid may be related to concentration of H ions within the organ. Finally certain infections as by organisms of the type of the bacillus of Koch may cause colloid to accumulate in the gland (*Thomas* 1933). These then are factors whose possible influence in determining the histological characters of goitre cannot be ignored particularly as they may vary with locality and as variation in histological structure with locality is an outstanding characteristic of endemic goitre.

A Cause of Confusion

It would seem that some of the confusion in regard to the causation of endemic goitre may be due to the

failure to distinguish between these two types of the disease A further source of confusion is the common practice of estimating the prevalence of goitre by surveys confined to school children These surveys conducted, as a rule, by visual methods of examination, clearly admit of many sources of error It cannot be too insistently stated that unless some reliable index of the normal size of the thyroid gland is employed in making such surveys the incidence of goitre in school children may be greatly exaggerated, erroneous inferences may be drawn as to its cause, or its prevalence be proclaimed in localities where, in truth, it may be practically non-existent Further, it is not generally recognized that during early life the thyroid gland normally grows more rapidly than the body as a whole and may exhibit this phenomenon as a visible swelling Without a knowledge of this fact, and without some reliable means of measurement of the size of the gland (McCarrison and Madhava, 1932), physiological swellings may be mistaken for pathological enlargements "If you can measure that of which you speak, you know something of your subject, but if you cannot measure it, your knowledge is meagre and unsatisfactory" (Kelvin)

Endemicity of Goitre

What determines the endemicity of goitre? In attempting to answer this question a distinction may be drawn between the cause or causes of the endemicity of goitre and the cause or causes of the incidence of goitre Clearly the endemicity is determined by something that is definitely localized in the localities where goitre prevails Up to the present time research has failed to reveal any *positive* agency to which the endemicity of the disease can be attributed Of *negative* agencies the only one known to us, and likely to be so concerned, is deficiency of iodine in the soils, and in the foodstuffs produced upon them, of localities in which goitre prevails McCarrison and Madhava (1932), as a result of their statistical study of all available data dealing with this question, came to the conclusion that "a low intake of iodine may, in certain circumstances of diet and hygiene, be a potent factor in predisposing to the occurrence of goitre, and may even be a determining cause of its endemicity" A low iodine-intake makes the operation of positive goitrogenic agents potentially possible, the first may determine its endemicity, the second its incidence

It seems probable that in the attempt to establish an inverse relation between the iodine-content of soil, food, and water, and the incidence of goitre we are again being led astray There is no reason why such an inverse relation, though possible, should be invariable For given a low-iodine intake the incidence of goitre will depend on the potency of the goitrogenic agents, or summation of agents, exercising their unhampered action in the absence of a sufficient intake of iodine to prevent it There is nothing more certain in regard to goitre than that a sufficient intake of iodine, or more properly a sufficient absorption and utilization of iodine, does counteract the action of all goitrogenic agents at present known to us, with the exception of vitamin deficiency In the absence of such agents a low intake of iodine may not by itself, cause goitre, while their presence will result in its occurrence, and if they be present in exaggerated degree they may even overcome the anti-goitrogenic action of a relatively high intake of iodine It becomes important therefore to know what these goitrogenic agents are and to continue the search for others Even though future research may reveal the existence of a goitre-nova to which both endemicity and incidence of the disease can be related, this nova, too, is amenable to a high degree of control by the prophylactic use of iodine In answer to the question above propounded it may therefore be said that, while there is much evidence connecting *the endemicity* of goitre with a low iodine-intake relative to goitrogenic agents, there is no sufficient evidence to justify the supposition that an inverse relation exists between *the incidence* of goitre and the amount of iodine available in a district

Goitrogenic Agents

These are (1) faulty diet (2) chemical substances, (3) insanitary conditions, and (4) infections

DIET

The more perfect the constitution of the diet the more normal the frequency distribution diagram of thyroid weights and sizes, the more stable the thyroid gland in point of size, and the less likely is goitre to arise The faults in diet that may give rise to goitre in animals under experimental conditions, and presumably therefore in man, are (A) Excesses of certain substances—fats, fatty acids, and lime (B) Deficiency of certain substances —iodine, vitamin A, vitamin C, protein (in association with vitamin A deficiency) and phosphates (relative to an excess of lime) (C) Goitre-producing substances—cyanogen compounds—in certain foodstuffs such as cabbage (D) Insufficiency of certain anti-goitrogenic substances, of unknown nature but other than iodine, present in certain fresh plants such as green grass, alfalfa, the expressed juice of steamed cabbage, and in sprouted legumes and carrots All these faults can be remedied and their goitrogenic action counteracted by the use of a properly constituted diet containing adequate supplies of iodine

Among foods rich, or comparatively rich, in iodine are those derived from the sea, eggs, goat's milk, lettuce, the outer leaves of cabbage, carrots, and, among condiments, ginger, black pepper, cumin, coriander, and cloves Sophisticated cereal foods, pulses, tubers root vegetables meat, sugar, jam, etc, are, in general, relatively poor in iodine The iodine content of foodstuffs varies within wide limits in different localities Thus that of green vegetables of different kinds may vary between 4 γ and 77 γ per kilo, that of cereals between 18 γ and 65 γ, that of pulses between 22 γ and 33 γ The minimum requirement of iodine is said to be 45 γ daily for adults and 150 γ for children of school age, yet in the goitre-free locality of Coonoor, S India, the average daily consumption of iodine by vegetarian schoolboys was found to be only 31 γ, or 11·3 milligrammes per annum, illustrating the fact that in the absence of positive goitrogenic agents a relatively low iodine consumption may not be associated with the occurrence of goitre

CHEMICAL SUBSTANCES

Among those capable of causing goitre in animals under experimental conditions are calcium boron, silica, tellurium, organic acids, amines (Pighini 1933), and cyanides (Webster, 1933) The goitrogenic action of all these substances is annulled by the administration of iodine The continued application of carcinogenic petroleum and shale oils or tars to the skin of mice causes thyroid enlargement in a proportion of them (Twort and Twort) it is preventable by the enrichment of the diet Anterior pituitary gland extract causes marked thyroid hyperplasia when injected for a few days into healthy animals thus indicating the close interrelation between the thyroid and pituitary glands Cyanide appears to act in the production of goitre by depressing tissue oxidation, with con-

After Influenza Pneumonia and other Acute Infections

The general action of 'Bynin'Amara is manifested by increased tone of the nervous, muscular and cardio-vascular systems It stimulates the digestive organs, improves the flagging appetite, corrects anæmia and aids nutrition generally

The marked asthenia and nervous depression which are prominent features of the post-influenzal state, yield rapidly to its influence A course whenever there is any indication of lowered resistance is a valuable safeguard against infection

In bottles at 2/-, 3/6, 6/6 and 12/-

AMARA

ALLEN & HANBURYS Ltd., London N.E.2

Standard in Gonorrhoea

ARGYROL

Brand Silver Vitellin

"Argyrol" is the original mild silver salt, unique in its field and unlike any other in therapeutic effect

For more than thirty years, Argyrol has been the standard in the treatment of Gonorrhoea No other silver sal has served the medical profession so long and successfully

Argyrol not only attacks the gonococcus but soothes the inflamed mucosa and stimulates tissue reaction

Its peculiarly sedative inflammation allaying qualities may be easily accounted for by pertinent chemical facts

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are used The pH and pAg of Argyrol are especially regulated for treatment of delicate mucous membranes Insure the results you expect—specify "ARGYROL"

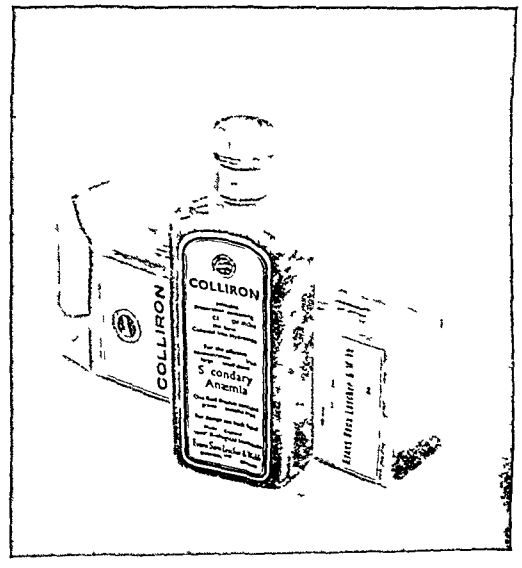
DEBILITY and FATIGUE

COLLIRON



(Evans)

Colloidal Ferric Hydroxide
with a trace of copper

Colliron is of particular value in stubborn anæmias as it can be given in a heavy dosage, if desired, without aggravating digestive trouble It has proved to be very suitable for the treatment of anæmias associated with Pregnancy and Hæmorrhage.

In every way Colliron is an ideal form of iron It is readily assimilated and is therefore prompt in its tonic action in debility and fatigue It is non-constipating and almost free from ferruginous taste

Being highly concentrated a small dosage suffices for average conditions

THE DOSAGE OF COLLIRON

5 minims of Colliron contains the same amount of iron as a Blauds Pill

Adults	20 minims three times daily after meals, or for intensive treatment, one teaspoonful once or twice daily, increasing to one tablespoonful two or three times daily
Children	5 to 10 minims three times daily after meals, or for intensive treatment, 15 to 30 minims once or twice daily, increasing to one dessertspoonful two or three times daily

Colliron is issued in

4 fld oz bottles - 3/-
8 " " " - 5/-
16 " " " - 9/6
80 fld oz bottles (Hospital size) 40/-

OF PREVENTIVE MEDICINE

Anti-Pneumococcus Serum

(Type 1) Concentrated

Anti Pneumococcus globulin solution is prepared from the serum of horses that have been immunized with virulent cultures of Type I pneumococcus Early administration of the globulin solution in cases of lobar pneumonia (Type 1) is of the greatest importance, because the antibody exerts its maximum effect when it is given within the first three days of the onset of the illness

DOSAGE—If possible the patient should receive an initial dose of at least 20 000 units followed by 10 000 units every eight hours until definite signs of clinical improvement are observed The globulin solution should be injected intravenously

In ampoules of 10 000 units 15/ each

In circumstances where the concentrated product cannot be used owing to its cost a natural serum is advisable Intramuscular injections are to be preferred when the natural serum is used and according to reports from various sources may be expected to give satisfactory results

MIL-SAN

the scientific contraceptive

MIL SAN is a bland, non injurious spermicidal jelly independent of variable physiological conditions of moisture or temperature Since there is nothing to melt, dissolve or foam MIL SAN is immediately effective

The formula of MIL SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina. Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane, (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple hygienic, and proof against carelessness Each application of 7 c.c. is contained in a specially made strong glass tube sealed at one end with a cork at the other by a hard wax plug In use the cork is removed a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube which is thrown away proves the application and ensures the quantity There is nothing to fill nothing to clean. Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions

Literature setting out the ingredients and full particulars together with a box of specimen tubes for examination are sent on request to members of the medical profession.

for RELIABILITY

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN" whilst free from rubber, possesses elastic properties and when carefully applied to the limb gives substantial support It is porous, adhesive, and non irritating, will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of 'Ceraban' Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages In the less severe of such cases a distinguished authority writing in the *Lancet page 580, Sept 7th 1935, issue* recommends the use of "Ceraban' Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by "Ceraban' It is waterproof antiseptic, and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

THE NOCIFENSOR SYSTEM OF NERVES AND ITS REACTIONS*

BY

SIR THOMAS LEWIS, M D, F R C P, F R S

Physician to University College Hospital London

LECTURE I

In these lectures I propose first of all to give an account of some recent discoveries of fact which have led me to believe that the superficies of the human body, including skin and mucous membrane is supplied by a hitherto unsuspected system of nerves, subserving a special function The nerves are distinct from those conveying sensory impulses though like the latter, they are comprised in the posterior root system I shall begin by describing briefly the chief observations and experiments†, which were directly responsible for these conclusions—evidence for a "nocifensor system of nerves, as I have termed it—and shall then proceed to discuss the relation of the reactions displayed to other reactions that have been recognized previously in skin

1 Spreading Hyperalgesia from Local Injury

It is well known that when skin is injured locally tenderness develops This is common to all subjects and to all kinds of injury provided that these are sufficiently severe and extensive But in many people tenderness develops readily even when the area of injury is quite small, as when a minute fold of skin is gripped and crushed by the points of a forceps, and the tenderness is found not only at the site of injury but as a delayed effect in a more or less widespread area of surrounding skin I must emphasize the fact that this tenderness around an area of local injury varies much in its degree and in its extent in different subjects Thus a tiny crush of the skin may yield in some no recognizable hyperalgesia in others it is sufficient to produce tenderness over a considerable area of skin It will be understood that subjects in whom this outlying tenderness is displayed in response to quite small injuries and in whom the tenderness is readily detected and wide spread are alone suitable for demonstrating the reactions to be described

Crushing the skin is perhaps the most convenient form of injury to employ because it is effected so easily and so quickly is so readily confined to a tiny area and is yet severe in its degree A tiny crush of the skin of the forearm in suitable subjects causes the development of a small area of surrounding hyperalgesia within a few seconds and this area gradually spreads to become full in about ten to twenty minutes The full area is oval in the length of the forearm and may be as long as 5 to 20 cm (Fig 1) It lasts for several or many hours

The hyperalgesia is not primarily caused by the effect of painful impulses on the central nervous system that is to say it is not referred from the brain or spinal cord Let a small cutaneous nerve of the forearm, such as the anterior branch of the external cutaneous be anaesthetized by injecting 1/2 to 1 c cm of novocain in the immediate neighbourhood of its stem and the injury then be made in the centre of the affected area when the skin is fully anaesthetic and analgesic The crush is unfelt nevertheless as soon as the nerve recovers the usual area of hyperalgesia is found around the injury It arises through a local mechanism and this mechanism is nervous This is suggested by the observation that if the injury has been made near the centre of the territory of a small cutaneous nerve, as ascertained by anaesthetizing the latter the area of hyperalgesia subsequently developing will be found to occupy a closely corresponding area of skin It is proved

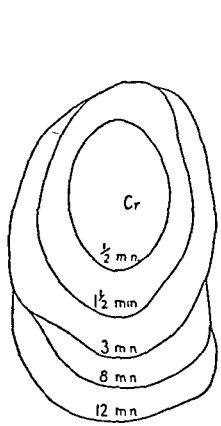

FIG 1

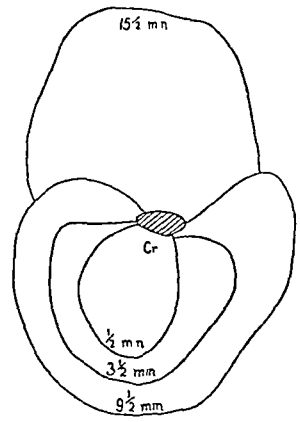

FIG 2

FIG 1—Half natural size A tiny fold of skin was picked up in the points of forceps and crushed at Cr Hyperalgesia was mapped out as it developed in the surrounding skin the contours are marked with the corresponding times in minutes

FIG 2—Half natural size An area of skin was anaesthetized (shaded area) with 1 per cent novocain to act as a barrier A tiny fold of skin (Cr) was crushed Hyperalgesia was mapped out as it developed the contours are marked with the corresponding times in minutes The anaesthetic barrier recovered between nine and a half and fifteen and a half minutes

COLSULANYDE

(Sulphanilamide, Crookes)

For the oral treatment of streptococcal infection of the blood
Intensive clinical experience has shown that cases of streptococcal infection of the blood stream respond rapidly when the drug is administered in the dose of 3 to 5 gms per day and so far as is known at present there are no contra-indications to the use of the drug

The indications include all streptococcal infections of the blood stream and associated conditions, such as meningitis, puerperal fever, erysipelas, septicæmia and associated broncho-pneumonia, tonsilitis, arthritis and otitis media

Full particulars, will be sent on request

by using local cutaneous anaesthesia The skin is injected intradermally with novocain, and the crush is made painlessly upon the centre of the small insensitive wheal of novocain Surrounding hyperalgesia does not develop in these circumstances The skin may recover sensation ten minutes or an hour after its injection, according to whether adrenaline has been introduced with the novocain or not, as it recovers, early or late, the usual hyperalgesia appears in the surrounding skin

This experiment is important from two points of view First the failure of hyperalgesia to appear while the local anaesthetic holds shows that hyperalgesia, when it occurs, is not due to the spread of a pain-producing substance which might be conceived to be released at the site of injury and to spread out into the surrounding skin it shows that the action depends on the functional integrity of the nerves of the skin Secondly, the development of surrounding hyperalgesia, as the area of crush recovers sensitivity, demonstrates that the capacity to provoke distant hyperalgesia resides in and is maintained by the crushed skin, the products of injury, so it may be conceived, act through local nerve channels as soon as these become unblocked The products of injury and not the pain of injury, are responsible, for as we have now repeatedly seen pain may be eliminated by blocking the nerves without affecting the reaction Further, the unanaesthetized skin may be injured painlessly as by suitably freezing it, and yet the result is the same That tissue products of injury are responsible is also supported by the fact that the time at which hyperalgesia develops depends on the intensity of injury, the time is shortest when the skin is smashed, it is long when the skin cells are injured but not killed, as when a faradic current or freezing is employed It is to be emphasized that the action happens through purely local nerve channels, the central nervous system is not concerned in this It is a reaction explicable only on the basis of what has been termed an "axon reflex," the impulse travelling up a nerve fibre and returning shortly through a side branch

We may proceed further to consider the arrangement and kind of nerve fibres that are involved When hyperalgesia fills a large territory in response to injury confined to a central and quite small injury it is clear that, if we conclude hyperalgesia to be provoked through local nervous channels, the small area of injury must be connected by nerve paths to all parts of the large territory Thus we are brought to believe that the nerves under consideration are nerves the axons of which divide freely to form arborizations or networks in the skin Further observations support this idea It has been stated that, when a tiny piece of skin is crushed in the centre of a small circular area of skin anaesthetized by intradermal injection of novocain, hyperalgesia appears only when the anaesthesia recedes and exposes the crush If the injury is made eccentrically then it becomes exposed earlier during the recovery and while the skin still remains anaesthetic on one side of it Under these conditions the hyperalgesia appears early on the side of exposure it fails to appear on the other side until the intervening barrier of anaesthesia has recovered Similarly, if the skin is crushed quite near to a barrier of locally anaesthetized skin (Fig 2) hyperalgesia develops, but again it fails to pass beyond the barrier Crush the skin a little further away and the hyperalgesia in this case tends to creep around the barrier Observations of this kind indicate that the nerves through which the reaction develops lie largely in the skin itself and seem to indicate that the fibres concerned belong to complex and overlapping arborizations rather than to networks

Hyperalgesia of the kind discussed is the ultimate result of a reduction in the threshold of sensory nerves subserving pain, but while this is to be accepted it should not mislead us into believing that the nerves through which the local state underlying hyperalgesia is provoked are pain nerves Consideration, indeed, shows that this cannot be so The nerve fibres primarily involved in provoking the reaction are freely arborizing because localization of painful stimuli, such as we know exists, could not be effected through a system of this kind, for impulses travelling from widely separated end branches of a given arborization would each finally travel by the same path and produce an identical effect upon the central nervous system An additional argument against nerves of pain being involved is that the nerves underlying the production of spreading hyperalgesia in response to local injury are very readily thrown out of action by asphyxiating them, while the pain nerves are much more resistant (unpublished observations) It is clear, therefore, that the pain nerves are concerned merely in registering an altered state of the tissues, and this altered state is produced through a distinct system of nerves But the argument, derived from our ability to localize stimuli, applies not only to the pain impulse but to all other forms of cutaneous stimulation, namely to touch, warmth, and cold, for all these sensory impressions are localized with accuracy, and none, therefore, can be subserved by a system of widely branching axons Of known nerves there remain only the sympathetic fibres, sweat nerves pilomotor nerves and nerves supplying blood vessels It is of interest to note that in the case of sympathetic nerves it has previously been concluded that freely branching axons having the required anatomical arrangement exist in skin, such has been proved for the pilomotor nerves (Lewis and Marvin 1927) But observation shows quite conclusively that the sympathetic system is not concerned in the production of spreading hyperalgesia, which can be as easily provoked by small injuries in skin deprived of its sympathetic nerves as in normal skin, this has been tested in patients from whom the cervical sympathetic ganglia have been removed and the nerves to the tested skin of the arm have been allowed to degenerate Now the sympathetic nerves and nerves of the posterior root system are the only nerves that supply skin, and complete destruction of the former leaves the reaction intact Therefore the nerves we seek must belong to the posterior root system, though as we have seen they are not sensory nerves Thus we are brought seriously to consider a system of nerves hitherto unrecognized That the sensory and sympathetic nerves form the complete cutaneous supply is an idea for which there is in fact no sure foundation We have come to recognize given systems of nerves by their manifestations first, sensory nerves, because they were found to convey sensory impressions to the brain, and afterwards vaso-motor, pilomotor, and sudoriic nerves as changes in blood supply, erection of hairs, and sweating have been recognized to be under the governance of nerve systems It will be evident that any system of nerve fibres, which in the exercise of its function gives rise to no obvious and distinctive external manifestations, will tend to escape recognition That is what has happened up to the present time in regard to the nerves now discussed The presence need to postulate a new system of nerves has arisen to explain hitherto unrecognized phenomena Because the nerves in question are associated with local defence against injury I call them "nocifensor nerves" The defence which I have primarily in mind is the protective hyperalgesia that has been described, but I also have in mind the possibility of other protective reactions to be described

Fatigue and Depression

Further evidence of the good effect of 'Benzedrine' on lowered mood

THE oral administration of 'Benzedrine' has recently been suggested to alleviate certain types of fatigue and depression

Myerson, working with normals and in cases of mild depressive neuroses, found small doses of 'Benzedrine' Brand Tablets of value in dispelling morning apathy, increasing the feeling of energy, and improving lowered mood

(Arch Neur & Psych, 36, 816, Oct, 1936)

In the treatment of narcolepsy, 'Benzedrine Brand Tablets have been found three times as effective as ephedrine in controlling the sleep attacks and cataplexy, and they have also been administered with success in post encephalitic Parkinsonism

'Benzedrine' relaxes gastro intestinal spasm whether of functional, reflex, or nervous origin Thus it facilitates X-ray examination after a barium meal, and clinically it has proved useful in such conditions as spastic colitis and pylorospasm

'Benzedrine' Brand Tablets

Each tablet contains 10 mg (0 1543 gr) β Phenylisopropylamine Sulphate (Isomyn Sulphate)

A clinical supply of Benzedrine Brand Tablets together with the latest literature will be sent to any interested physician on request

Distributed by
MENLEY & JAMES LIMITED 64 HATTON GARDEN LONDON E C 1

* Benzedrine is the Registered Trade Mark of Smith Kline & French Laboratories to designate their brand of β Phenylisopropylamine (Isomyn)

I pass to the second reaction

2 Hyperalgesia from Distal Stimulation of Cutaneous Nerves

Hyperalgesia of the skin can be provoked not only by injuring the skin locally but also by stimulating cutaneous nerve trunks The nerve can be stimulated by faradic current either through the skin or preferably by introducing a small and special electrode through the skin Such hyperalgesia is confined to and usually fills the territory of the corresponding nerve The change produced in the affected skin is undoubtedly the same as that produced as a spreading response to local injury, the hyperalgesia has the same qualities, develops after delay and slowly, and lasts for correspondingly long periods of time We may conclude without hesitation that in both instances the same special system of nerve fibres conveys impulses to the skin, though the impulses start from an area of injury in the one case, and directly from the nerve

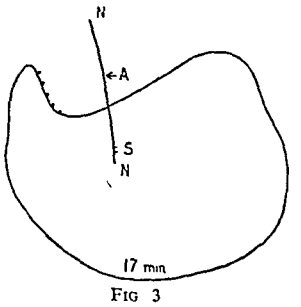

Fig 3

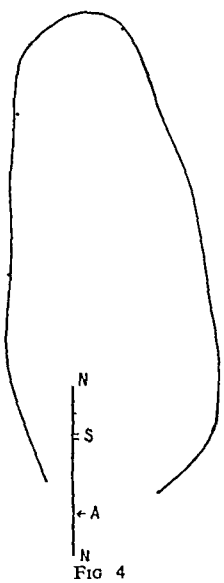

Fig 4

Fig 3—Half natural size A subcutaneous nerve NN was anaesthetized at A by local injection of novocain the area of defective sensibility resulting is mapped by the dotted line The nerve was stimulated by faradic current passing through the skin into the nerve at S proximal to the block The only hyperalgesia subsequently developed is shown by the area mapped by the solid line at seventeen minutes (From *Clinical Science* 2 386)

Fig 4—Half natural size The same nerve was anaesthetized at A and stimulated distal to the block at S The area of hyperalgesia developed after the recovery of the block is mapped by the solid line (From *Clinical Science* 2 386)

trunk in the other That the action in the case of nerve trunk stimulation is a distal one, and is not brought about through the conduction of impulses to the central nervous system, and by reflection or reference from this may be proved in this instance also If the nerve trunk is blocked by a little anaesthetic injected into it, and it is then stimulated above the block (Fig 3), hyperalgesia does not develop subsequently in the nerve's territory, though the central nervous system receives the full sensory stimulus But if stimulation is below the block (Fig 4) it is painless and when the block recovers the usual area of hyperalgesia is found Thus the evidence is harmonious in showing that there is a common end effect, a changed condition of the skin produced through a local and common effector mechanism

It will be of interest briefly to discuss the nature of this change in the skin which is common to the two reactions described, though it cannot be said that we are more than beginning to understand it When the skin is injured locally and surrounding hyperalgesia is allowed to develop, local anaesthetization of the damaged skin will not abolish the hyperalgesia, which continues unchanged under as much as an hour's observation Once hyperalgesia has appeared it is maintained, although receipt of new impulses has been brought to an end through the blocking of the nervous channels issuing from the site of original injury, the change which has happened in the affected skin is a relatively stable affair A precisely similar stability is shown in the case of the hyperalgesia provoked by direct nerve stimulation In this instance there is no durable change at the point of nerve stimulation, which might be thought to maintain a state of hyperalgesia in the skin, for nothing develops in skin which is guarded by peripheral nerve block over the actual period of nerve stimulation, when that block is released It is again clear that the skin supplied by the nerve is itself the seat of disturbance and that the change that happens there is a lasting one For reasons which I cannot satisfactorily and fully relate in these lectures I have interpreted this change (Lewis, 1936) to be an altered state of the skin cells, with a discharge from these of substances that by acting locally, reduce the threshold of the pain nerves In this connexion it is of interest to note that Foerster (1925) has recorded the occurrence of pain during distal stimulation of divided cutaneous nerves in man On the lines already laid down I attribute his interesting observation to the release of pain producing substance which acts on overlapping endings of neighbouring sensory nerves, and find support for this view in Foerster's statement that section of these neighbouring nerves abolishes the pain

While it is legitimate to conclude in my own observations that the hyperalgesia, accompanied as it often is by a little sense of burning, and the pain in Foerster's observation are both due to the onset of a new and relatively stable state in the affected skin, the view that this comprises a release of pain producing substance must be recognized as more hypothetical It will remain so until more direct evidence of actual release becomes available That the nerves act by increasing the permeability of the walls of the cutaneous cells, and thus cause a release of substance or substances is but one of several possible ideas which might plausibly be put forward in explanation But it is the conception which at the moment I am most inclined to favour

Clinical Applications

Before passing on to other reactions of the skin I pause to comment on certain practical clinical bearings of the observations that have been described The first reaction that of spreading hyperalgesia in response to local injury is an event of everyday life Such hyperalgesia is often to be found around abrasions and other small injuries of the skin for example those produced by insect bites Areas of hyperalgesia, extending widely around inflammatory lesions of the skin almost certainly arise through a similar mechanism So does tenderness referred from stimulation or inflammation of the mucous membrane of the maxillary antrum (Fig 5) or from teeth in the upper jaw, to skin in the territory of the maxillary nerve Thus it is evident that the observations and experiments described bring a clear understanding of

Improved
ANAL APPLICATIONS

INDICATIONS *Hæmorrhoids, Anal Fissures, Pruritis ani.*

Fissan Brand Anal preparations incorporate their carefully balanced soothing and healing constituents in a physical state of high dispersion with increased surface action and efficacy

The base is a milk albumin fat emulsion with marked penetrating power for the mucous membranes, possessing antipruritic and healing properties

many instances of superficial hyperalgesia such as are encountered in patients As to whether or nor referred cutaneous tenderness from visceral disease employs the same effector mechanism will be decided by new investigations

The second reaction the production of hyperalgesia through stimulation of cutaneous nerves, finds its counterpart in certain cases of peripheral nerve lesion The cases to which I refer are those relatively rare ones, examples of which were first recorded by Paget (1853) Charcot (1859), Weir Mitchell (1872), and others, in which as a result of bullet wounds or other injury the nerve in a limb (usually the median), though undivided is contused, or becomes involved in chronic inflammation In such cases and after a notable latent period of a few or many days the skin of the corresponding territory becomes exceedingly tender to friction and intolerant to warmth The pain like all continuous skin pains, is described as burning in quality—whence the term "causalgia"—and is so easily elicited and so severe when provoked that the patient guards the limb closely, holding it flexed and covered and shrinking from all threatened contacts Such cases have long been suspected to owe their suffering to

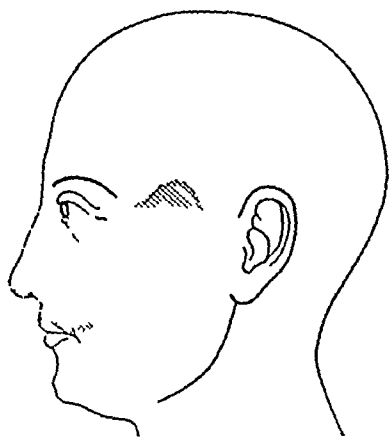

FIG. 5.—A diagram of hyperalgesia of the facial skin appearing within an hour of stimulating the mucous membrane of the outer wall of the maxillary antrum with a faradic current Similar hyperalgesia appears with catarrh of the same antrum (from *Clinical Science* 2 393)

irritation of the nerve trunks, sensory impulses being conveyed directly to the sensorium from the region of the wound But my observations provide a definite basis for a new suggestion namely, that the pain may arise from the irritation not of sensory but of "nocifensor" fibres in the nerve trunk In the latter instance it would arise indirectly and after a period of delay the state of the skin being changed and thus lowering the threshold of the pain nerves running to it The existence of such a mechanism the pain provoking agency being in the skin and not in the nerve trunk would explain those curious and otherwise inexplicable instances cited by Tinel (1918) in which section of the nerve distal to the nerve lesion has brought relief of pain Another reason for suspecting an action of the damaged nerve distally is found in the associated changes in the skin, including reddening and herpetic eruption but further discussion of this aspect of the question I shall defer to my second lecture

Another type of case is that in which a finger has been crushed torn or otherwise injured and in which though healing occurs similar intractable tenderness and pain develop and often spread to the adjoining finger In these instances of reference to an adjoining finger it has become quite probable that the painful phenomena are produced through the intervention of nocifensor nerves, though it is to be stated that further observations directed to this question are desirable as opportunity offers.

We pass on to the third reaction

3 Flare from Local Injury

The flare surrounding local injuries has been so fully described in my writings on the "triple response" that I shall here confine myself to what is relevant to the main thesis of these lectures If a small piece of skin is crushed or is injured in any other way a vascular flare appears around it This flare is due to the dilatation of the small arterioles in the skin over an area usually of about 5 cm diameter, though sometimes visibly extending for much greater distances It has been proved to occur through the intervention of a nervous reflex, the impulses travelling locally through branching axons of skin and directly underlying tissue Thus the flare can be provoked after all nerves to the skin have been divided It disappears when after section the fibres of the cutaneous nerves have had time to degenerate It is lost when the posterior root ganglia (or the fifth nerve ganglion) have been destroyed, but it is not lost after degeneration of the sympathetic nerves to the skin has taken place Thus the nerves underlying this reaction are known to belong to the posterior root system and for this reason have been thought to be sensory This latter view, based as it was on reasoning by exclusion, I am unable any longer to hold The resemblance between the nervous mechanism of this reaction and that of spreading hyperalgesia is so close as to draw strong attention to itself The reason for first suspecting the nerves underlying the hyperalgesia to be separate from any of the sensory nerves was that the phenomena displayed require for their explanation a branching system of axons a system regarded as incompatible with accurate localization of sensation A parallel argument applies in the case of the flare The stimulus that provokes this flare arises locally nerve impulses pass out from a small place of injury and travel to small cutaneous arterioles supplying the whole area flushed Thus each small area of skin must be united through axonic nervous channels to all regions displaying vasodilatation A branching system of axons incompatible with the function of sensory localization, is again needed to explain this local reflex

It is to be noted in the case both of flare and hyperalgesia that the original stimulus is a small local injury like a crush and that in each instance independent evidence has been obtained that the receptor endings of the nerves are stimulated by substance released The paths taken by the nerves through the skin, as displayed by the effect of anaesthetic barriers are remarkably similar in the two instances Asphyxia affects both reactions early, though the flare is affected distinctly later than the hyperalgesia (unpublished observations) All this evidence leads us to conclude as in the case of hyperalgesia so in the case of the flare, that the nerves concerned are not sensory but that those underlying the two reactions are related to each other But further than this in identification we cannot go

I have described the similarities that seem to me sufficient to allow us to place these nerves in a common system There are also important differences The substances released by (and at the point of) injury and responsible for the two reactions are different The flare is caused by the release of a histamine like substance the substance causing hyperalgesia is certainly distinct Again the end manifestations are different in character and they are of very different duration Each reaction may have its appropriate stimulus and receptor

MEDICAL BENEFIT FOR YOUNG ADOLESCENTS

SPECIAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL AND PANEL COMMITTEES, THURSDAY, JANUARY 7, 1937, AT 2 p m

Early Discussions

The programme of Government legislation for the current session in Parliament includes a measure for the extension of medical benefit under the National Health Insurance Act to young persons who are between the ages of 14 and 16 and in insurable occupations At the invitation of the Ministry of Health representatives of the Insurance Acts Committee met representatives of the Ministry on November 4th 1936, to hear certain *tentative* proposals in relation to the contemplated legislation These preliminary proposals may be summarized in the following terms

(1) The persons affected by the proposed legislation will be those males and females who have left school and entered insurable occupations

(2) It is estimated that the number of persons admitted to insurance at the outset will be in the region of 700 000 (The number is now estimated at 1 000 000)

(3) The benefits available to this class of insured person will be

(*a*) medical benefit identical with that available to other insured persons (subject to para 4)

(*b*) a reduction in the waiting period for dental benefit

(4) The existing terms of service will apply except those referring to certification In the absence of sickness benefit, certification will not be required of insurance practitioners

(5) In the view of the Ministry there is justification for suggesting a capitation fee of less than 9s on the *following two grounds*

(*a*) No medical certification will be required

(*b*) The amount of medical attention required of insurance practitioners in respect of these insured persons will be *less* than that required in respect of the existing insured population It is argued that the stage of childish infections has passed and that the stage of adult illness has not arrived

(6) The capitation fee tentatively suggested as a basis of discussion was six shillings

During the explanations and discussion which followed the Insurance Acts Committee's representatives made it clear that in their view the financial proposal in the present form would prove entirely unacceptable to the Insurance Acts Committee They emphasized that the suggestion that the medical care of these young persons would prove less onerous than the care of other insured persons generally was one which could not for one moment be accepted

Action of Insurance Acts Committee

At the meeting of the Insurance Acts Committee on Thursday November 19th the following three resolutions were passed

Min 70 Resolved That the Committee is of opinion that there is no ground for differentiation of the standard capitation fee for treatment on account of the incidence of sickness amongst the proposed new class of insured person

Min 71 Resolved That any variation of the standard capitation fee for treatment is opposed to the principle of insurance upon which national health insurance is based

Min 72 Resolved That it be represented to the Ministry that whilst certificates for national health insurance purposes may not be required for insurance purposes some form of certification of incapacity will in practice be necessary and that it is desirable that *this* should be included in the contract of the insurance medical practitioner

The following general statement of the Committee's views was approved as a basis of representations to the Ministry

(i) The Insurance Acts Committee has given careful consideration to the report of its representatives who met representatives of the Ministry at *the latter's invitation* on November 4th 1936 It understands that it is proposed shortly to introduce legislation to secure the inclusion in *national health insurance* of young persons under 16 who have left school and secured employment in an insurable occupation that it is intended to provide medical benefit and in the case of those who *join certain* approved societies a reduction in the period of qualification for dental benefit *that* except for medical certification the duties and obligations of medical practitioners in respect of these young adults will be identical with those undertaken in respect of the existing insured population that the Ministry is considering a capitation fee less *than the* standard rate on the grounds that medical certification will not be required and that these persons need less medical care than other insured persons

(ii) It is desired at the outset to refer to the important principle involved in the suggestion *that the young* adolescent requires less medical care than the adult It

is an understatement to say that the Insurance Acts Committee is astonished to learn of the view of the Ministry of Health that the duties of medical practitioners in respect of these persons are less onerous and less responsible than for the insured community generally The development of national health insurance in this country has been characterized by a growing recognition on the part of the community and the medical profession in particular of the profound importance of preventive medicine, of the early detection of disease, and of the speedy and efficient treatment of apparently trivial complaints The Committee had assumed that the outlook of the Ministry of Health had been expressed in such statements as the following, made by the Chief Medical Officer in his annual report for 1933

> 'The insurance medical service is that branch of the public health services which, under the terms of the National Insurance Acts is concerned with the prevention and treatment of disease as it affects the individual members of the insured population The importance of the service to the national endeavour towards raising the level of the health of the people as a whole and increasing the value of the life and capacity of each citizen can scarcely be overestimated The medical practitioners who provide the service, by virtue of their opportunities for the early detection of disease in the individual form the first line of defence against communal disease and they provide also in most cases the best instrument for the prompt application to individuals of those preventive measures and improved methods of treatment which science puts at our disposal

(iii) While the items of service which medical practitioners render to these young people are different in kind, they are *more* rather than *less* important than those rendered to older members of the community

(iv) While the conditions which bring the young adolescent to the doctor may, in some measure, be classified on clinical grounds as minor, they are major in their importance to the individual and to the community The Ministry's proposal to remunerate insurance practitioners at a 'cut' rate for services rendered to these young adolescents would, if adopted, inevitably damage the national health insurance service as an important agency of positive health—as opposed to its function of healing established disease—and would not encourage insurance practitioners to give to these young adults the full preventive and curative service which they need It should not be necessary to point out that the phase of transition from the sheltered years of school life to the early years of wage earning is very commonly a difficult and trying one, when the friendly supervision of the family doctor is of paramount importance The State ensures—and rightly so—that during school life the child is subject to careful medical supervision and the prompt treatment of defects, minor and major The suggestion that in the years that intervene between leaving school and attaining the age of 16 the need for medical supervision is not only less than that necessary during previous years, but also less than that which is necessary in the years following the sixteenth birthday is an extraordinary one Such a suggestion might be construed as an admission that the national health insurance system in this country is regarded by the Ministry of Health not as an enlightened progressive agency to promote health and prevent disease but as a narrow restricted service concerned only with the treatment of established disease It is a retrograde and reactionary proposal

(v) The suggestion was made by the Ministry representatives to those who represented the Insurance Acts Committee that the *number* of items of service rendered to these persons was to day less than those rendered to the adult community If this were so it would be contrary to the interests of the community to encourage and perpetuate such a state of affairs by governmental action But in fact there is no evidence that this suggestion is well founded

(vi) It was admitted by the Ministry representatives that there is no statistical evidence of any value on this subject Death rates provide no indication of the incidence of sickness demanding medical attention statistics relating to infectious disease show only that its incidence is less in this age group than in the school and pre-school age groups the figures for incapacity periods relate only to illness which incapacitates for longer than three days The distinguishing feature of much of the sickness experienced by the young adolescent is that it does not kill and does not incapacitate for work tonsillitis, anaemia septic infections, minor accidents, ear infections, and skin diseases are examples

(vii) The only reliable guide on the subject is the experience of general practitioners in actual practice, and it will not be denied that the Insurance Acts Committee is well equipped to express an opinion It is their experience that the number of items of service rendered to young adolescents in this age group are no less numerous than those rendered to the present insured population By governmental and other propaganda this section of the community is being encouraged to seek the advice of the medical profession To give an example of official encouragement to seek doctors services, the Ministry should bear in mind that the widely accepted policy for improving physical fitness will add to the profession's responsibilities in respect of these persons The young adult is looking more and more to his doctor for advice on minor troubles, an attitude which it is in the public interest to encourage and which, it is assumed, the Ministry of Health would desire to encourage in any extension of national health insurance The act of including these persons in national health insurance would inevitably and properly have the effect of encouraging them to seek the help of their doctor in increased numbers

(viii) At present the medical profession accepts, under national health insurance, a liability for all groups of both sexes of the insured population at an 'overall' capitation rate without seeking a precise relationship between the number and kind of items of service rendered to the different age groups The suggestion of a different rate for young adolescents involves the introduction of a new principle a differential rate for different age groups In the view of the Insurance Acts Committee and—at least on previous occasions, in the view of the Government—this is an undesirable and unwise proposal—directly opposed to the principle underlying the existing basis of remuneration If it were introduced the Committee would feel compelled to consider seeking as a logical step its wider application in national health insurance, and in particular, its application to the increasing proportion of old people in the insured community, and to female insured persons

(ix) The Ministry proposes that there shall be collected from the 14½–16 group the sum of 3d per week After setting aside a sum to be applied to the reduction of the period of qualification for dental benefit and meeting administrative costs, but six shillings is to pass, on this proposal, to the insurance practitioner Thirteen shillings is the "pegged' cost of medical benefit from which is met all costs of full medical benefit, the primary purpose of the contemplated legislation is to secure for these persons medical benefit While no one would desire to minimize the value of dental benefit it is a monstrous proposal that from the moneys collected there should pass to the approved societies sums of money which will in certain of them, and those only, find expression in a reduction in the period of waiting for dental benefit Any direct payment to approved societies for the purpose of dental benefit can only, under existing arrangements, aggravate the existing inequalities in relation to additional benefits

(x) It is recognized that certification for national health insurance purposes will not be required of insurance practitioners for these entrants to national health insurance Had certification been required it would

mechanism, each may have its distinct effector mechanism ending the one perhaps on skin cell and the other perhaps on arteriole These possibilities are all in accord with the facts as these are known, and we should be justified, therefore, in regarding the two series of nerve paths as separate The general conception would be similar to that which we take in the case of pilomotor and sudorific nerves Here also are two series of nerves following similar branching axonic paths in the skin, but they arise differently, end in connexion with different cells and produce for that reason dissimilar effects, but both belong to the same general system, the system of sympathetic nerves

FOOD AND NUTRITION*

BY

E P CATHCART, C B E, M D, F R S

Regius Professor of Physiology University of Glasgow

[In the opening part of his lecture Professor Cathcart gave a brief review of the food side of the problem in the light of present day knowledge stressing the great gaps in this knowledge that still exist]

When we turn to the question of nutrition we enter a realm which is largely speculative There are those who hold that the state of nutrition is definitely and by inference only an index of the adequacy of the diet Personally, in common with many others, I believe the state of nutrition indicates much more than the adequacy of the diet

We all believe that we can decide, with a certain degree of assurance, whether the state of nutrition of a given individual is good or not, and yet at the same time if we were asked to state why we reached our degree of certainty we would be hard put to it to give an explicit answer In other words, we do realize that in this state there is something more involved than mere physical attributes like stature, bulk, bloom of skin, gloss of hair, and so on, that there are also intangible psychic factors which may be summarized in terms like alertness 'fitness' 'aliveness We judge normally by the 'whole ness of the picture It is a question of the primacy of the whole over the separate parts We arrive at our assessment by a kind of intuition based on our own particular experience

I have no doubts in my own mind that the term nutrition should be retained for a wide conception of the state of well being which characterizes the individual who is both physically and psychically sound Those who wish to refer only to the influence of food on the body who in other words wish to limit their conception would have quite a useful and sufficient word in *alimentation* They could speak then of states of good and bad alimentation—that is the states resulting from the ingestion of adequate or inadequate diets If the words were not quite so exotic we might adopt, for differentiation, the words used by the Greeks—*eusitia* and *eutrophia* I understand from my classical colleagues that the Greeks more precise in the use of words than we are, differentiated between well fed (eusitia) and well nourished (eutrophia) These words have the additional advantage that a negative form dysitia and dystrophia may be used I believe it must be accepted that when we speak of, say excellent nutrition (eutrophia) and malnutrition (dystrophia) we are speaking of clinical syndromes because in everyday practice it is found there is no physical yardstick by which the degree of nutrition can be measured Moreover, every medical man realizes the extent to which physical conditions like weight can be dominated by psychical states and how, for instance, an immobilized limb can atrophy despite an adequate food intake It is quite clear to me at least that when we use that much abused term malnutrition we are referring to a state of the body which is not solely dependent on the inadequacy of the food intake, that many other factors like lack of sleep, of play, of fresh air of happiness absence of worry and so on play parts in the determination of the condition It is admitted of course that an adequate supply of proper food is absolutely essential but food alone cannot work miracles

"Malnutrition"

I have stated that there is no measure by which the degree of malnutrition can be defined, hence it is not surprising that where each individual medical officer makes his own subjective judgement, a judgement which can be distorted by all manner of personal, but probably in the majority of cases unconscious predilections wide variance in the extent to which malnutrition is reported to exist in given areas is to be expected Until some standard some method can be devised which will rule out these individual predilections no finality can be reached It is not that the search for such a measure has been neglected Repeated attacks have been made on the subject and each time the examining committee has fallen back on the clinical findings

The question of the extent of malnutrition, be the cause what it may has given rise in recent times to great debate, much of it extraordinarily ill informed One of the greatest of statisticians in this country Mr Udny Yule speaking recently on the fall which had taken place in the death rate, said

> That such a change must mean a very great improvement in the condition of the poorer part of our population which forms the great majority of it seems to me obvious and I think this cheering story deserves some special emphasis at present when there is much talk some of it sensible but some of it a bit lurid and some of it—I think it is hardly too much to say—a little hysterical on such matters as housing unemployment and nutrition Some of it indeed is to me almost incredible for if any large proportion of our population be as seriously undernourished as it is sometimes represented the existence of such low death rates becomes difficult to explain and if unemployment were as grave a factor as is sometimes alleged it would be odd that unexampled unemployment should be accompanied by record low mortalities

This comment receives support from the evidence collected by school medical officers which despite its variable quality, does not disclose the existence of much serious and widespread malnutrition

To my mind the comment of Mr Udny Yule is just timely, and proper No one could be stupid enough to claim that all diets in this country are ideal when it is well known that many are faulty but I do not believe they are so desperately bad as claimed by some writers As Mendel said

> There is no field of practical importance related to human well being in which there is greater opportunity for dogmatism and quackery for pseudo science and unwarranted prescrip-

RONTOSIL ALBUM IN PUERPERAL SEPSIS

BY

M A TOULIS, M D

Assistant Superintendent and Resident Surgeon

AND

JOHN B BARR, M B , Ch B

enior Resident Medical Officer Robroyston Hospital Glasgow

A rapidly growing literature, from both the experimental and clinical aspects, proves beyond reasonable doubt that prontosil constitutes an invaluable measure in the treatment of severe streptococcal infections Recent articles, both in this country and abroad, suggest that its usefulness may not be limited only to infections by haemolytic streptococci In puerperal sepsis, however, the treatment of this streptococcal infection is of paramount importance, since it is responsible for almost all the deaths

The following brief notes represent our experience of prontosil album ' (the sulphonamide) in the treatment of puerperal infections The use of this simpler ' reduction compound of prontosil seems logical in the light of recent experiments (Colebrook, *et al* 1936) which demonstrate that the original compounds, prontosil soluble and prontosil ' red, are active against haemolytic streptococci only in so far as they are broken down in the body to the sulphonamide or some closely related substance Certainly it has been shown that *in vitro* prontosil is not lethal to streptococci, whereas the sulphonamide, prontosil album, can destroy them under conditions of dilution fairly closely approaching those which might be encountered in the body

The Patients Treated

Prontosil album was used in treatment, in a ward given over to puerperal sepsis from November 1, 1936 and these notes may be regarded as covering the period from that date till January 31, 1937 During the period under review seventy patients all proven septic, came into hospital for treatment There was one death, giving a mortality rate of 1 4 per cent The average death rate over 1 988 patients all of whom were septic, treated between the years 1931 and 1936 was 13 5 per cent The use of prontosil album was limited to twenty two cases—namely, women who were severely ill, having repeated rigors, frank septicaemia, or peritonitis This group comprised eleven with septicaemia four with peritonitis and seven others Three patients each received up to 20 c cm prontosil soluble on occasion, owing to a temporary shortage of prontosil album One other received 40 c cm prontosil soluble on each of three successive days

The great drop which has occurred in the death rate raises prominently the possibility that the seventy cases under discussion were less severely ill than those treated in the past It is agreed that the death rate in puerperal sepsis is closely bound up with the occurrence of septicaemia and peritonitis In the present group there were eleven cases of septicaemia, eight of which yielded a growth of haemolytic streptococci on primary blood culture The incidence of septicaemia in the whole group is therefore 15 7 per cent , the average incidence from 1931 till 1936 being 18 6 per cent There were four instances of generalizing peritonitis without blood invasion and on laparotomy three yielded cultures of haemolytic streptococci The incidence of peritonitis of 5 7 per cent is to be compared with 4 per cent , which was the average incidence over the five years ending in 1936

It would seem therefore, that while there has been a slight drop in the incidence of severe sepsis the fall in death rate must be explained by improved treatment or lessened virulence of the infecting organism

Dosage and Toxicity

In the beginning the dosage used was small but with increasing experience this was raised to 7 2 grammes (twenty-four tablets of 0 3 gramme) spread over twenty four hours for averagely ill patients This dosage, it was discovered, could be continued for seven to ten days without harm It was found advisable to continue medication for two to three days after subsidence of the fever Increase in the dosage in more severely ill patients was almost always accompanied by a corresponding clinical improvement In one very severe case of septicaemia a daily consumption of 14 4 grammes (forty eight tablets) for four successive days and 7 2 grammes for a further three days was followed by nothing worse than a slight cyanosis possibly attributable to sulphaemoglobinaemia Another case of septicaemia received 40 c cm prontosil soluble and 10 8 grammes prontosil album for three successive days and 7 2 grammes each day for a further two days with again nothing worse than slight cyanosis possibly accounted for by the pneumonic septicaemia which demanded such heroic dosage Both cases recovered In one instance it was noticed that a daily dosage of 10 8 grammes was ineffective till 15 minims of dilute hydrochloric acid were given somewhat empirically, before ingestion of the tablets

From the remarks above it is obvious that the toxicity of prontosil album is low Sickness and vomiting occurred in one case after a total dosage of 75 grammes spread over nine days and ceased on discontinuing the drug The urine from several highly dosed patients showed no casts but mild albuminuria appeared twice where it had not hitherto been present In three patients difficulty in micturition developed amounting almost to retention of urine There was no oliguria In no case was jaundice recorded nor were there nervous symptoms Sulphaemoglobinaemia was noticed as a possibility in the two cases already mentioned when dosage was discussed In this respect it may be mentioned that magnesium sulphate which it is thought, may have some causal influence, was given in one case only In the other the probability of sulphur compounds being present in commercial glucose cannot be ignored

A much larger number of patients have been treated with the sulphonamide prontosil album than with the original injection preparation, *prontosil soluble* So far as the death rate gives any indication the two drugs are apparently of equal value The obvious advantages of an easily ingested preparation over large and sometimes painful injections need only be mentioned Some of the temperature charts reviewed suggest that the action of prontosil album is more rapid than that of prontosil soluble even allowing for the quicker absorption of the latter On present knowledge of the pharmacology of these drugs it would appear reasonable to combine the two preparations the injections acting perhaps as a depot of continuous sulphonamide therapy In severe peritonitis the ingestion of large numbers of tablets possibly roughly chewed by the patient and the swallowing of considerable amounts of fluid may be open to objection

tions and proscriptions, than in the domain of our daily diet '

The difficulty is that so many people think they are authorities on the subject of food and nutrition in general, and they do not hesitate to air their views, forgetting, or more often ignorant of, the number of problems, particularly quantitative ones, still unsolved They forget, moreover, that in problems where the factors concerned are for the most part incapable of accurate measurement their knowledge about the subject must, as Kelvin pointed out long ago, be meagre and unsatisfactory Under these conditions these would-be experts only too often darken counsel by words without knowledge

Indices of Nutrition

As measures of the state of nutrition the indices commonly adopted are height and weight and the relation of these to age Certainly both height and weight are capable of fairly accurate measurement Weight as an index is, however, of very little value, as it is a well-recognized fact that the capacity to put on weight varies considerably with the temperament and particular constitution of the individual child or adult The thin wiry child is, indeed, from the medical point of view fitter and more resistant on the whole than the fat overfed child Weight may be due to big heavy bones, to much muscle, or to excess fat

More emphasis has rightly been laid on the height factor The stunted growth of the child which has been brought up in a faulty environment of whatever nature is a well-recognized phenomenon There is no question that when such children are removed to a good environment the improved physique which results is remarkable These are established facts But recently there has been an active drive to transfer this possibility of improved physique from the particular to the general, the inference being that the bulk of the general population would respond in like manner In his presidential address to the British Association last year Sir Josiah Stamp gave currency to the following statement

> It has been computed that a benevolent dictator could, at a relatively small expense by applying our modern knowledge of diet, add some two inches to the average stature and seven or eight pounds to the average weight of the general population besides enormously increasing their resistance to disease

I do not think anyone would question the ability of the so called benevolent dictator to increase the body weight but there might be a considerable measure of doubt as to whether all his efforts in the way of selected diet would add two inches to the average height and also increase enormously the resistance of the population to disease I think it may be said it is generally believed that if it were possible to devise the perfect diet suited to the needs of each individual the resistance to disease might be increased so far as mortality is concerned but without much reduction in morbidity Tuberculosis is the one disease to which there does seem to be fairly good evidence that a well-fed body is more resistant

Rate of Growth, and Ultimate Stature

When we turn to the consideration of the possibility of increasing the average stature from a present average of approximately sixty seven inches to sixty-nine inches the food supply of the benevolent dictator would have to contain some very stimulating ingredients ingredients potent enough to defeat hereditary inertia At the outset we must differentiate between rate of growth in the young and ultimate stature in the adult Stature is not so subject to environmental influence as weight It is much more static, it is an inborn character, determined more by heredity than environment The hereditary influence has been stated to account for over 90 per cent of stature It is true there is a certain small amount of evidence to suggest that the Nordic races at least are gradually growing taller Such deductions have in the main been drawn from the growth of both male and female students in certain American universities, yet, on the other hand, the authors of the volume on statistics relating to the great mass of recruits for the American Army in the late war are more cautious They compared their data with the Army data of the Civil War some fifty years earlier and found little apparent change in height, although there was a few pounds increase in weight After due consideration of all the factors they inclined to the belief that the average stature in the United States had actually decreased by about one half-inch, due probably to the immigration of shorter races The same view concerning the increase of height of the student class has been put forward in this country Sir Arthur Keith holds, however that "the evidence so far leads us to believe that our present stature and size of body are part of an ancient inheritance, one which has not been altered by the passage of hundreds or thousands of years" Yet the environmental changes both as regards housing, hygiene (personal and public), the quantity and quality of food, during this long span of years are prodigious

So far I have been speaking of the average ultimate stature of the adult The evidence, I think is plain that it is largely dominated by racial or hereditary characteristics which, if they can be altered at all, must be altered extraordinarily slowly When, however, we turn to the consideration of the rate of growth in stature, the phenomenon characteristic of the young, we are faced with quite another problem There is no doubt that a faulty diet may be a most potent agent in inhibiting growth in general The experiments of Mendel and Osborne and many later workers are quite clear on this point But the evidence is equally clear that this power to grow is only inhibited, not destroyed The inhibition may even be of very long duration The urge to grow in the young is as strong as life itself Further, the capacity to reproduce is not lost when growth is inhibited nor is the capacity to provide milk suitable for the normal growth of the young despite the faulty diet consumed by the mother The growth capacity of the young from such mothers is not affected, for if after weaning they are put on a suitable and adequate diet they grow at the normal rate Moreover, it must be noted that all the evidence goes to show that although it is easy to inhibit increase in body weight by adverse environmental conditions it is difficult to check the persistent growth of skeletal structure

Factors in Limitation of Growth

It is probably, one might almost venture to say certainly, true that one of the most potent factors in limiting the growth of children is either absolute lack of food or the consumption of food qualitatively inadequate Still, if it be admitted that inadequate food is an important causal factor there are other factors, such as faulty housing, lack of exercise, lack of sleep, etc, which play contributory parts For instance, some very interesting Glasgow data on the growth of school children have been put forward to show the apparent close relation between growth and the size of the house occupied by the parents

Case Reports

Below are set out the abbreviated records of three cases illustrative of the type of result obtained The first case is one of septicaemia with peritonitis, the second one of what appears to have been, despite the absence of confirmatory blood culture, septicaemia associated with multiple bacterial emboli The third case is one of moderate severity, and is quoted to complete the clinical picture

Case 1—A 5 parous woman aged 30 years was confined on October 30, 1936, when the perineum was badly torn She sickened on November 1 with rigors cough and abdominal pain, and was admitted on November 3 On admission the temperature was 104° F, the pulse rate 128, and the respirations 34 a minute She was very pale, and had a gross patchy bilateral bronchopneumonia with extensive pleural friction Peritonitis was present up to a level higher than the umbilicus A blood culture which was taken on admission yielded a liberal growth of haemolytic streptococci An immediate laparotomy revealed a generalizing peritonitis, which was drained The sero pus yielded numerous colonies of haemolytic streptococci She was given 0 9 gramme prontosil album four hourly (three tablets) as soon as she could swallow The following day her peak temperature was 101° and within forty eight hours was normal Prontosil album was continued for five days at the same dosage The convalescence was interrupted by the development of phlegmasia alba dolens

Case 2—A woman aged 31 years, 2 para, was confined on December 30, 1936 There was no gross trauma, but she sickened on January 5, 1937, with rigors, headache, and a scarlatiniform rash We admitted her on January 11 with patchy bronchopneumonia and a widespread scarlatiniform rash tending to vesiculation on the face and soft palate There were numerous acutely inflamed painful indurated areas beneath the skin on the arms, knuckles, and legs There was possibly early effusion into the right elbow- and the left ankle-joint Blood culture was negative, but the patient was undoubtedly septicaemic At the beginning of therapy by prontosil album 1 8 grammes (six tablets) four-hourly her temperature was 103 2°, pulse rate 128, and respirations 24 a minute She was slightly cyanosed Allowing for doses missed during sleep she received a total of 250 tablets (7 5 grammes) prontosil album in four hourly doses over nine days by which time the illness was over The rash, induration and vesicles retrogressed on the fourth day of treatment, and the joints, once thought to be the seat of septic arthritis, were free of pain and swelling on the seventh day One larger induration which became semi fluctuant and from which it was hoped to culture an organism, was totally absorbed

Case 3—A girl aged 19 years was confined on December 8 1936 A persistent occipito posterior presentation resulted in a severe perineal tear She sickened on December 10 with an erythematous rash and a rise in temperature to 107° and a pulse rate of 160 a minute She was immediately given two tablets of prontosil album and this was repeated in four hours She was admitted to Robroyston Hospital on December 10 with a temperature of 99 pulse rate 104 and respirations 24 a minute Her symptoms were suggestive of acute metritis She was given prontosil album two tablets (0 6 gramme) four hourly for four days after which the temperature was normal A blood culture taken on admission, yielded scanty haemolytic streptococci

Summary

1 Out of a series of seventy cases of puerperal sepsis twenty two were treated with the "sulphonamide" preparation prontosil album Four of these had, in addition, occasional doses of prontosil soluble by injection The other forty eight cases were not considered sufficiently serious for chemotherapy

2 Eleven of the twenty-two cases treated with prontosil album had septicaemia, eight proved by blood culture to be due to haemolytic streptococci, and a further three cases of peritonitis without septicaemia all yielded haemolytic streptococcal colonies on culture of the peritoneal fluid The balance—seven cases—showed a haemolytic streptococcus on bacteriological examination of the vaginal discharge

3 The dosage of prontosil album was high, ranging from 3 grammes (ten tablets) to 14 4 grammes every twenty-four hours, but the preparation was well tolerated and toxic effects were minimal

4 The fall in temperature and the general improvement were rapid and striking

5 The success of the treatment is evidenced in the mortality rate of 1 4 per cent (one death) in the whole series, as compared with 13 4 per cent in a five-year period in the same hospital

Clinical Memoranda

Method of Removing Wax Foreign Bodies from the Bladder

From time to time reports are published of the removal of pieces of wax from the urinary bladder by means of rongeur forceps, lithotrites, or even by suprapubic cystotomy (One transatlantic clinician recently reported how a patient had succeeded in voiding a piece of wax by urinating while suspended upside down from a trapeze) It does not appear to be sufficiently widely recognized that a number of wax solvents, such as xylol, will deal with this type of case with a minimum of discomfort to the patient Hattinger was the first, I believe, to describe the use of xylol for this purpose

I have recently come across two cases in which wax had been introduced by a male patient along the urethra for erotic purposes, and, as so often happens, the distal portion of the improvised wax bougie broke off, the remainder entering the bladder, whence it did not escape, and set up an inflammatory reaction

The first case, a boy of 16, was brought to me a few days after the "incident" had occurred He was suffering from frequent and painful micturition, and no attempt was made to hide the origin of the trouble Cystoscopy revealed the presence in the dome of the bladder of a flattened piece of wax about the diameter of a shilling The cystoscope was withdrawn, a catheter passed, and the bladder filled with 6 ounces of sterile water, 10 c.cm of xylol was then introduced, and the catheter spigoted The catheter was left in position for two hours, the suprapubic region being massaged at frequent intervals to aid the solution of the wax by the xylol On removal of the spigot the bladder emptied, the terminal few cubic centimetres being a white milky fluid representing the wax in solution A cystoscope was then introduced, and no longer was there any evidence of the wax

A few weeks later a similar case came into All Saints' Hospital under the care of my colleague, Mr F. Loughnane The history in this case did not give an inkling as to the cause of the dysuria but cystoscopy revealed the presence of a piece of wax in the dome of the bladder I related my experience in the first case and the same procedure was adopted in this second case with complete success

London W 1 TERENCE MILLIN

It is possible to speed up the rate of growth in the underfed child both in height and weight, it is possible even to alleviate or cure malnutrition, but the height ultimately attained will be, in general, that predestined for the particular individual As Deniker wrote

The primordial characteristics of race seem always to get the upper hand and the modifications produced by environment can alter the stature of the race only within very restricted limits The miners of a high stature like the Scots for example will be still taller than the individuals of the well to do classes in for example Spain or Italy and much more so than those of Japan Stature is truly then, a character of race and a very persistent one

Food Not the Only Factor in Good Nutrition

My contention, then, is that without in any way detracting from the value of food as an all important factor in good nutrition, it is impossible to accept food as the only factor Food alone will never achieve the results claimed and apparently expected. Food intake, no matter how abundant and well selected, without, for example, exercise or adequate sleep, will not determine the state of good nutrition It is relatively easy to develop eusitia (well fed ness), but a much more complex and intricate problem to develop eutrophia (good nutrition) It is probable that on the whole it is easier to make up early deficiencies of diet than deficiencies of physical culture in the broadest sense of the term

I repeat, I do not desire to belittle the importance of food or to suggest for a moment that many of the diets in common use are beyond criticism Unfortunately we have had ample evidence that many of the present day diets leave much to be desired Far too often it is stated, more often perhaps assumed, that the defective diets are solely the product of lack of means It is common knowledge, knowledge confirmed for me at least by our dietary surveys, that frankly bad diets can be found in households not in the receipt of the lowest incomes It would on the other hand, be simply the height of folly to assert that income shortage is never to blame in whole or in part.

Diets and Budgets

The question is often asked why, if the needs of the organism be known, some body of experts does not sit down and work out–the cost of such provision If the assumption be made and it is only an assumption, that we know (*a*) the fundamental needs of the human organism, and (*b*) the sources from which these needs may be completely satisfied, it would seem to most people to require but a simple sum in arithmetic to solve the problem of the relation of an adequate diet to the family budget But unfortunately in practice the solution is neither easy nor simple It is not how much money is spent on food but what is obtained with the money spent and how the purchases are used which counts Academically it is perfectly easy to devise simple yet so far as our knowledge goes, complete diets which will satisfy all needs at a relatively low cost, but, again unfortunately the majority of human beings are not content, like many of the domesticated animals to live day in day out on a monotonous diet The difficulty is that the majority of mankind want and demand change and variety, a demand which in the end increases cost There is indeed, no hard-and fast scientific solution of the practical problem There are too many variables, and not the least of these are those which are associated with the likes and dislikes, the traditional beliefs customs, and conventions of the consumer It must not be forgotten that there is a definite psychological aspect to the problem of diet

We have only to turn over the pages of the recent report of the International Institute of Agriculture to find evidence for the diversities which exist in dietary demand If race A, which consumes 73 lb of meat per head per year, is fit and healthy, is race B, which eats 236 lb of meat per annum, overfed and pathological? Or is race C which consumes 6 71 bushels of wheat per head per year leading a physiological life when race D manages to get along on 2 5 bushels per head per year? Further even within the limits of a single country like our own for various reasons there is a very wide range in the prices of ordinary standard foodstuffs For which consumption of meat or wheat for which price level are we expected to budget, and are we to budget for the good housewife and cook or the bad and careless one?

I am convinced that a mere increase in wages or allowances will not solve the question of defective diets There is no guarantee that the extra money, if given will be spent in a proper fashion As Professor Forrester said in a recent address when speaking on the relation between incomes of the relatively poor and prices,

increase in purchasing power would only be partly spent in remedying deficiencies in dietary since people would attempt to increase their satisfaction on all items in the standard of living and not merely on food It would require some specific measure of public intervention to secure the whole of the increase for food expenditure

Moreover, even if it were all spent on food, there would be no guarantee that the proper materials would be purchased and utilized to the best advantage The solution where immediate action is required, would be the provision of cooked meals, as is done in schools But this is no permanent solution Although I do not believe that the average working class housewife merits the damning indictment of the Frenchman Siegfried, in his book *England's Crisis* it is probably true that as compared with the average Frenchwoman of her class she does not have their 'sense of or delight in economy Do not imagine, he concluded that the French workman though he receives less than half as much money [as the English workman] lives only half as well"

The Need for Education

Improved education on what can be done in the way of dietary is badly required—education in budgeting, marketing, and cooking Too often it is assumed these are easy arts to practise, that every woman receives them as inborn gifts On the contrary, they are difficult arts, only to be acquired by patience and time The education must be such that it is suited to the needs skill, and intelligence of those who require assistance and as the experience of such institutions as welfare centres clearly shows the majority of the mothers are eager and willing to be taught We are not an imaginative people where food is concerned, and the food shopping list is very limited Many of the really valuable foodstuffs are neglected If it be well to include in the diet a good supply of first class proteins why is greater use not made of fish? Why is herring one of the most excellent of protective foods relatively neglected? Why is more use not made of cheese, of liquid skim milk where available or of dried skim milk? Much of the modern cereal food stuffs could with great advantage be replaced by potatoes which provide vitamins B and C iron and readily available calcium and phosphorus The British Medical Association has made an excellent start with the recent publication of its small book, *Family Meals and Catering*

Reviews

SURGERY OF CANCER OF THE LUNG

a Chirurgie du Cancer du Poumon Bases Anatomo lniques et Experimentales Technique Operatoire By Lambret M Malatray and J Driessens (Pp 198 Illustrated) Paris Masson et Cie 1936

physician should always be on the alert for the sible presence of a neoplasm of the lung but it is the son who eventually establishes the diagnosis and es whether treatment is practicable Drs Lambret, Malatray, and Driessens of Lille have written a mono which should therefore prove of great interest to thoracic surgeons It forms an admirably practical mmary of the present position in regard to a subject ch has only just passed the experimental phase The thors dismiss radiotherapy as having proved a failure in treatment of cancer of the lung, and confine themselves a discussion of lobectomy and total pneumonectomy latter is to be preferred, since in expert hands it gives superior results and is now carried out with only slightly greater operative mortality

As their subject is so recent (and the literature limited) authors have been able to present it in a succinct and cal manner The diagnostic basis of the surgical treat- is discussed in three stages (clinical, radiological d bronchoscopic), and there follows a description of e anatomo pathological details essential in decidin whether surgical intervention is justified The indications r surgery are then given, and the detailed description the operative technique of pneumonectomy—and less ily of lobectomy—is preceded by a chapter on the perimental work which has now been carried out for any years A chapter is devoted to the results of *rgical treatment of broncho pulmonary cancer Up to* e time of writing the book fifty eight cases had been ported in the literature (all confirmed histologically) which forty were treated by lobectomy Of the total mber twenty five (43 per cent) were "cured" eleven living four to seven years after the operation It is great interest that while the operative mortality of the ectomy cases was 30 per cent as against 50 per cent the pneumonectomy patients, the former show 'cures" to three years) in 10 per cent and the latter in 40 per nt (but of course, out of a total of only eighteen es) Certain points in regard to the lobectomy cases summarized in tabular form, and more detailed notes furnished of the pneumonectomy patients (with two sonal observations)

Throughout the book full credit is given to the Brompton hool of surgeons And a final point to be noted is insistence on the safety of exploratory thoracotomy, hich offers at present the only means of securing a larger mber of treatable cases The volume is exceptionally ll produced and contains several good plates and a full liography (since 1928 only) It is a work that can be rtily recommended

PATIENT, NURSE, AND HOSPITAL

he Patient Looks at the Hospital By Florence G idler Foreword by Joan Malleson M B B S (Pp 28 2s 6d net) London Robert Hale and Co 1936

en writing this indictment both of hospital manage- nt and of the whole nursing profession Miss Fidler got the value of understatement in the presentation of ase The chief faults of her book are so manifest that they can do little harm They are, that an entirely one sided picture is drawn in most exaggerated terms by generalizing from an isolated personal experience, and that while she has supplemented her first hand knowledge by an intelligently chosen course of reading she picks out only those portions which lend themselves to the heightening of the picture Illustrations of these faults can be found on many pages Here are two

'the quite peculiar mentality of the trained nurse—a queer mixture of expert knowledge of her subject an intense devotion to duty an unlimited capacity for self sacrifice on the one hand on the other immeasurable conceit abysmal stupidity complete lack of imagination often a mean petty attitude towards others and always a deficiency of common sense and intelligence in everyday affairs

'there are no really grateful patients and the reason why *persons* sometimes express themselves as such is that they have been so terrorized while in hospital that they feel obliged to pretend and to make false statements lest if they return there they may suffer from not having expressed the correct amount of gratitude demanded

A further point to be noted is that, although in her final chapter the author directs her case against the voluntary hospitals only and advocates a State service, there is no reason at all why the faults which she so strongly alleges should not be just as prevalent in council as in voluntary *hospitals* Nevertheless the book may be worth reading It at least draws attention to three things of importance that the conditions of work of nursing staffs are unsatisfactory that ward routine is defective, and that all subscribers to all voluntary hospitals (to whom the book is dedicated) should not be content with giving their subscription but ought to show an active concern in the conduct of the institution to which it has been given

MEDICAL GYMNASTICS AND MASSAGE

The Technique Effects and Uses of Swedish Medical Gymnastics and Massage By Dr J Arvedson Translated by Mina L Dobbie M D B Ch Third edition (Pp 262 131 figures 12s 6d) London J and A Churchill 1936

The third edition of Dr Arvedson's book, which appeared in Sweden in 1932, has been translated into English by Dr Mina Dobbie, to whom credit is also due for translating and editing the companion volume—*Medical Gymnastics and Massage in General Practice* Both books are well known, because they cover the course for students preparing for the examination of the Chartered Society of Massage and Medical Gymnastics The present volume contains all the material necessary for a thorough grounding in the movements and manipulations used in Swedish gymnastics and massage and is hence invaluable to those wishing to qualify for the examination and to practise the system All procedures are described clearly their effects and uses explained and the working muscles in each case enumerated The descriptions are supplemented by photographs numbering about eighty These fulfil their purpose clearly, but some of them are so antiquated in style as to be unsuitable for inclusion in a modern textbook If military recruits instead of women had been the models photographed there would be less cause for criticism but the rigid lordotic postures of, for example, Figs 17 and 32, should be suppressed rather than displayed as exemplary

It is unfortunate that Ling's system which was primarily intended to develop the physique of soldiers has had such a militaristic influence on gymnastics It was certainly successful in its purpose but has become too general in its application In other countries Denmark and America notably gymnastics for women and

Concluding Remarks

In conclusion I should just like to say a word regarding those who do not require to consider every penny spent on food Faulty dieting is not uncommon among this class, where appetite is, as a rule, the sole dictator of intake It is true that certain workers have stressed following the dictates of appetite, but it is very difficult to say whether this is always a sound line or no in the human being There is ample evidence that it is an effective guide in the case of certain animals like pigs, dogs, and rats, which are not pampered and are given a free choice in the selection of their food There is no question about the fact that apparently perfectly normal human beings exhibit wide variances in their food preferences, based often, I believe, on real but probably more often on imaginary needs Again I emphasize the point that in this question of food the problem is frequently as much psychological as physiological "Better a dinner of herbs, where love is, than a stalled ox and hatred therewith" is very sound doctrine The great danger is that people develop a pathological interest in food, that they become food-conscious due to the superfluity of ill advised chit chat concerning the virtues or evils of this or that article of diet It is infinitely more profitable to follow the advice,

> "Eat all kind Nature doth bestow,
> It will amalgamate below
> If the mind says it shall be so
> But if you once begin to doubt
> The gastric juice will find it out"

THE "DISPOSITION" AND THE SPECIFIC ALLERGEN IN ASTHMA, HAY FEVER, AND OTHER ALLERGIC CONDITIONS

BY

E M. FRAENKEL, M D.

The phrase "allergic disease" means no more as a diagnosis than the terms 'infectious disease" and "metabolic disease' Three alterations in the normal behaviour of the tissues are considered to be characteristic of allergic conditions and reactions The most striking of these is the constriction of the smooth muscles, such as takes place in the bronchial spasm of asthma, in the spasm of the bowel in spastic colitis, or in the vascular spasm that is presumed to take place in migraine The second alteration is a localized exudative increase in the water content of certain tissues, such as occurs in the skin in Quincke's oedema and in the mucous membranes in rhinitis and other catarrhal conditions The third alteration that is often present is a generalized or localized increase in the eosinophils In most cases a combination of all three of these conditions is characteristic

The Allergic Reaction

This type of so called "allergic reaction," particularly the constriction of the smooth muscle fibres, is an effect that can be produced by irritation of the parasympathetic nervous system It is therefore conceivable that anything and everything causing such an irritation would result in the same complex of symptoms and that everything capable of counteracting this irritation could be used as a therapeutic or prophylactic agent The parasympathetic irritation might be due to a reflex action from a special area An abnormally high irritability of an area, as in the conjunctivae and the nasal, bronchial, and intestinal mucous membranes, might therefore be responsible for the onset of reactions induced by irritants harmless to less sensitive parts or persons On the other hand, it shows that the hypersensitivity towards irritation at one spot does not usually mean that there exists a general hypersensitivity of all tissues of the body, and it is in this way that the localization of the irritability may be produced

The irritability of the parasympathetic nervous system, however, depends on such general metabolic factors as the balance of potassium and calcium salts in the mineral content of the tissues The calcium acts as a stabilizing factor, in a similar way other metabolic factors may act as sympathetic or parasympathetic irritants, and others may prevent this irritation For example, such endocrine products as pituitrin and adrenaline counteract the irritation of the parasympathetic by counter-irritation of the sympathetic, whereas a drug like atropine protects the parasympathetic from irritation It may thus be understood that the constitutional behaviour of different types of patients at different periods of life—as at puberty and during the menopause—or while subject to endocrine disturbance, can so alter their irritability that they become hypersensitive towards otherwise innocuous irritants The regulation of the sympathetic nervous system by the higher centres and by psychic factors may work in both directions, causing either an increase or a decrease in the irritability Cures brought about by suggestion therapy cannot therefore be used as proof of the psychological origin of the irritability

Disposition Towards Allergic Irritation

Irritability of the sympathetic nervous system cannot be neglected in the investigation and treatment of allergic patients It is the variation in the conditions mentioned above that we may call the disposition of the patient towards specific allergens A change in both local and general irritability may be brought about by a variety of factors To these is added the factor of the external irritant, the so-called allergen A number of allergens are so powerful that they produce an allergic condition in all persons exposed to their action These are followed by a number ranging in potency down to those so weak that they give rise to symptoms in only a few particularly susceptible persons Hay-fever pollen, for example, affects about 1 per cent of the population of large towns, whereas it has been found in Switzerland that the country people are affected only to the extent of about 0 2 per cent of the population This shows clearly that the same allergen has a different effect upon a population under different conditions, and that the disposition plays a definite part in allergic diseases

The mechanism of an allergic reaction is probably similar to that of an anaphylactic shock or to that of parasympathetic irritation in general It has been shown by Dale and others that both anaphylactic shock and nervous irritation are either followed or caused by the formation of acetylcholine in the tissues, acting in a similar way to histamine in causing contraction of the smooth muscles It is not yet quite clear whether these or similar compounds can be split off from the supposed allergen, or whether, in the case of allergic reactions, they are produced by the cells of the subject under the influence of a specific parasympathetic irritation

Theoretically any type of irritation, physical or chemical acting in conjunction with the factors described above could give rise to any one of the reactions known as allergic In point of fact the well defined allergens

children are not made to conform to this military mould, and the results are excellent from physiological and aesthetic standpoints In describing manipulations used in massage Dr Arvedson makes one statement which may cause confusion On page 219 we read "Colon-stroking aims also at giving a direct onward impulse to the intestinal contents", but it is well known that any mechanical propulsion would be dangerous and that reflex effects are the only justifiable aim

Though struck with admiration for the thoroughness and conscientiousness of Dr Arvedson's book, we are aware of a disquieting sense of the limitations of the system, and wonder if it is not time, "Lest one good custom should corrupt the world," for the whole outlook on Swedish gymnastics to be fearlessly revised There is a tendency to concentrate too closely on certain isolated groups of muscles, to strengthen these by repetitive work in the gymnasium, and then to discharge the patient with an exhortation (too often futile) to continue exercises at home The need would appear to be for a "far-off" view of the patient, so that the why and wherefore of faulty muscle habits may be understood before attempts are made to correct them And when correction is possible in the gymnasium the muscle action achieving it should be studied with a view to its incorporation, in the long run unconsciously, in the movements of everyday life Systems of "duly exercises" will not suffice, even if correctly performed, unless the muscles concerned are brought freely into ordinary use

DIXON'S PHARMACOLOGY

A Manual of Pharmacology By Walter E Dixon, M A, M D, F R S Revised by W A M Smart, M B, B S, B Sc Eighth edition (Pp 483 79 figures 18s net) London E Arnold and Co 1936

The first appearance of Dixon's *Manual of Pharmacology* in 1906 was an important event in the development of pharmacological science The outstanding features of the book were the manner in which the actions of drugs were clearly and dogmatically defined and the beautiful experimental records that illustrated these actions The textbook has maintained its popularity ever since, and it is pleasant to learn that it has survived the untimely death of its author and is to be carried on by Dr W A M Smart

The eighth edition has retained the general form and size of its predecessors, but the contents have been completely revised Some of the most obvious changes are that the graphic records are less prominent, while a great increase has been made in the use of structural formulae Clinical observations on the action of drugs are now included, and there has been a liberal insertion of prescriptions illustrating the practical application of the subject matter These changes have affected the general character of the work Dixon's textbook was primarily concerned with the action of drugs as revealed by animal experiment, whereas in its new form much more attention is paid to current therapeutic practice As regards the choice of prescriptions the author has deferred here and there to clinical traditions in a manner that we think unfortunate An elementary textbook of this kind is intended to introduce the student to the rational use of drugs, and it would seem desirable to choose prescriptions whose composition can be defended on logical grounds In some cases however, prescriptions are given containing traditional complexities, the rational basis for which is not immediately apparent—for example, the combination of ammonium, potassium, and sodium bromides, and the combination of the powdered leaves of stramonium, belladonna, and hyoscyamus Other prescriptions preserve clinical traditions that are now being discarded—for example, the three prescriptions for iron salts which are given contain 1 2, and 3 grains of iron salts respectively

In view of the fact that the book has been revised with a distinct trend towards therapeutics, it is rather surprising that more space has not been devoted to the hormones, but insulin and the thyroid together occupy less than a page Apparent irregularities such as these are bound, however, to occur in a textbook which is in a process of revision, and considered as a whole the manual gives a very clear account of the outstanding facts of modern pharmacology, and the free use of structural formulae has made it possible for Dr Smart to show clearly the important services that organic chemistry has given to therapeutics in recent years

PSYCHIATRY

Theory and Practice of Psychiatry By William S Sadler M D (Pp 1,231 42s net) London H Kimpton 1936

Dr William S Sadler, the chief psychiatrist and director of the Chicago Institute of Research and Diagnosis, has written a voluminous work on this subject He explains that while there is an abundance of literature dealing with the psychoses from the institutional point of view, there seems to be a dearth of practical literature on the non-psychotic groups of nervous disturbances, affording help to the physician in general practice or occupied with one of the many specialties in his efforts to aid those of his patients who are more or less neurotic or who may be suffering from more serious mental and nervous ailments It is with the idea of helping to meet this need that the book has been written

It has thus been the motive of the author to help professional readers of all classes rather than to confine his text to the recording of experience for the exclusive perusal of the psychiatric specialist He hopes in this work to contribute something which will assist the medical profession in divesting mental hygiene of many of its psychiatric mysteries and deliver it from the "confusion of tongues"—the sectarian clamourings—that have served so to obscure the "common sense" methods of study and practice which the rank and file of the profession are well qualified to undertake if they are once delivered from the "mystifications" of the multifarious teachings of the conflicting schools of psychiatry

This massive tome is perhaps rather heavy for those who have no training in psychiatry but it will certainly be most useful to those who have taken up psychiatry as a career

OSTEOLOGY

Bones A Study of the Development and Structure of the Vertebrate Skeleton By P D F Murray M A, D Sc (Pp 203, 45 figures 8s 6d net) London Cambridge University Press 1936

This is a new book written from a point of view somewhat different from that of the standard textbooks on osteology It deals with the development and structure of the vertebrate skeleton, and is partly founded on recent experimental work carried out by the author and his colleagues at the Strangeways Laboratories, Cambridge, and partly on that of previous workers at the same school and at others He discusses anew many of the problems bearing on the interaction of heredity and mechanical factors in the growth and determination of form of such long bones as the femur or humerus, and emphasizes the importance part played by heredity in determining the specific form of the primary cartilaginous model of a long bone

are usually thought to be of the nature of proteins, and with such chemical substances as 'sozol,' salicylic acid and pyramidon it is believed that a compound of these and of the proteins of the body has been formed and endowed with allergic properties The mechanism of such a reaction will be understood when I refer to Landsteiner's allergens, where a compound of such chemical substances as benzyl chloride with various proteins was effected These compounds produced group specific antibodies and reactions towards the chemical substance in question, and not towards the protein

The Specific Allergen

The specific allergen is well known in hay fever and the asthma occurring in furriers, as well as in certain other cases It is also recognized in the urticaria produced by foodstuffs—for example, strawberries and crayfish—or by primula These examples show that there exists a very wide range of substances that can act as allergens The allergen can enter the body by means of inhalation, as in hay fever and in furriers asthma Such air borne allergens are a very common cause of allergic conditions The allergen may enter the body in the form of a foodstuff in urticaria and in the eczema of babies who are given unsuitable food Foodstuffs may also provoke an attack of asthma or of mucous colitis

The entrance of allergens through the skin is known to occur in many eczemas of occupational origin, and an example of the subcutaneous mode of entrance is afforded by the 'serum sickness' that sometimes ensues from treatment with horse serum These examples demonstrate another important fact—namely, that the site of entrance of the allergen is not identical with the organ in which the symptoms are manifested A parenteral injection may give rise in the skin to urticaria or Quincke's oedema, in the bowels to colitis or in the respiratory tract to asthma or to rhinitis, the same is true of other modes of entrance of the allergen

Experience has shown that an allergic reaction is from the beginning as specific as any other immunity reaction The allergy usually begins with a hypersensitivity towards one or two well-defined allergens (monovalency) Gradually however, if the condition does not receive proper treatment, the body becomes more and more sensitive towards other allergens (polyvalency) It is to be recommended that in these cases the threshold of sensitivity be raised rather than an attempt be made to remove any allergen in particular This can of course be accomplished by the treatment of constitutional factors as well as by desensitization

In other cases however the role of the specific allergen is predominant and the detection of this and the subsequent protection from or immunization against it constitute the only satisfactory method of treatment There are allergens which, in a similar way to a universally pathogenic micro-organism result in allergic symptoms in all who come under their influence An example of this was afforded by Frugoni and Ancona who found that peasants suffered from asthma after working in fields infected with a certain species of tinea and there is also the example of the purified allergen produced by Bloch and his collaborators from primula which provoked urticaria in everybody who received an injection of it

Many attempts have been made to isolate the responsible chemical compounds from the various allergens It is for instance considered probable that in hay fever carbohydrates of a similar structure to the antigenic carbohydrates existing in bacteria are responsible We have, on the other hand, some experimental evidence, obtained from the use of masks equipped with filtration apparatus that in epidermal allergens such as feathers it is probable that they are more of the nature of an essential oil or of a protein in such a fine state of subdivision that it is dissolved with facility in the microdroplets of water present in the atmosphere

TWO EXAMPLES

The specificity of the allergen may be illustrated by two cases

A young lady recently married had before marriage suffered from asthma when living in her parents house but had been free when living in a boarding house in town After her marriage she invariably suffered from attacks of asthma at night As an extract of feathers produced a positive skin reaction she was sent to a sanatorium where she was advised to sleep on bedding free from feathers and here she was entirely free from any symptoms Subsequently while travelling she often slept on feather beds in hotels but never suffered from any attacks On her return home she slept once more on her own feather bed and the asthma immediately returned Extracts from the feathers in her bedding gave a very strong skin reaction and she admitted that her bedding had been brought from her parents home On my advice she disposed of the bedding in question not without first getting a violent attack after beating and cleaning it It is probable that some contaminating substance was present in these particular feathers and it was this substance that produced the marked specificity

Another lady suffered from severe attacks in Konigsberg but was completely free in Berlin It was possible to show that the inhalation of the street dust of Konigsberg was responsible for the asthma and positive skin tests were obtained with extracts of this dust whereas no such results were obtained with the street dust from Berlin

These two examples show that such substances as dust and feathers are in reality very complicated mixtures of a large number of individual substances, and are not comparable with a specific allergen from a definite mould bacterium, or grass pollen

Diagnostic Methods

The only real proof that a particular allergen causes the allergic condition is the production of this in the patient after exposure to the allergen and the cure of the condition subsequent to its removal *Such an experiment is of* course, disagreeable for the patient, and although the attack can be controlled by the judicious use of adrenaline involves a certain degree of risk Nevertheless the exposure test and the removal test are the diagnostic aids that finally decide the specificity of the causal allergen The first may be used with appropriate caution in a clinical institution, where every aid is at hand should it be necessary to deal with an unwanted reaction The second may be safely used in private practice In private practice however the most important diagnostic features are the history of the patient and of his family regarding allergic complaints and their relation to factors in their surroundings, both professional and domestic These diagnostic features also include an eosinophilia of the blood and of the excreta including both sputum and stools and the production of skin reactions with extracts of alleged allergens

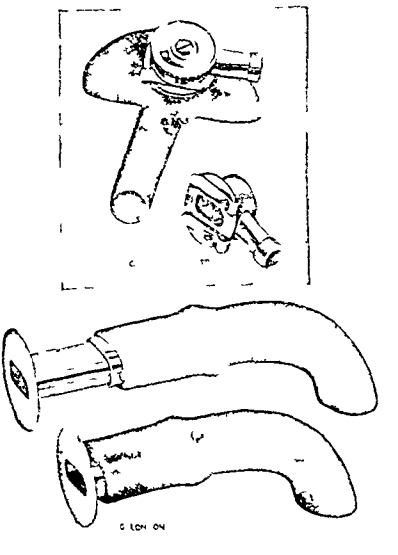
With the exposure test I have been able to determine the exact mode of entrance of the air borne allergen by means of a mask that afforded protection to the conjunctivae, the nasal mucous membrane or the mouth or to any combination of these It was already known that the protection of the conjunctivae by goggles would prevent the onset of rhinitis and asthma in some hay fever patients

Beginning with the description of the differentiation—of an explant taken from the axial condensation of mesoderm the limb bud of a chick embryo—into the *cartilaginous* rudiment of a long bone the author proceeds to discuss the development of the *bony* skeleton from the cartilaginous model and the functional changes which take place secondarily as the result of mechanical stresses He further considers the microscopical structure of cartilage from the mechanical standpoint and the mechanism of bony adaptations in the later stages of development The author's comments on the following subjects are particularly interesting the formation of joints ankylosis pseudo arthroses, ectopic formation of bone, and changes in form due to variation in function, as illustrated by the form of the calcaneus in a child at birth an adult man the orang—which is arboreal in its habits—and the gorilla and baboon—which live chiefly on the ground A well marked similarity in form exists between the calcaneus of the orang and the human infant, whereas when the child begins to walk the heel bone assumes the flattened form which characterizes the plantigrade type present in the gorilla and baboon The bearing of the trajectorial theory on the architecture of bone and Triepel's hypothesis of the harmonic adaptation of structure to external form are well presented and discussed

The book is clearly written and singularly free from bias it is well illustrated and contains a representative list of references and should prove a useful stimulus to further work on the subject

Notes on Books

Mr GREGORY BATESON'S *Naven* (Cambridge University Press 18s) is an anthropological study based upon the author's two expeditions to the Iatmul people who live on the middle reaches of the Sepik River in the Mandated Territory of New Guinea Naven is the term applied to certain ceremonies performed in celebration of major or minor achievements and these ceremonies are characterized by the custom of men dressing up as women and women dressing up as men The achievement invariably honoured by naven is homicide which at any rate until recently was often perpetrated at a very early age, a small boy being assisted by the appropriate sponsor to drive a spear into the living body of a bound and helpless captive Minor cultural acts celebrated only on first achievement include the killing of certain animals the planting of certain plants making a canoe and spotting an opossum in the bush Mr Bateson's object is to relate the ceremonial behaviour of naven by means of a new technique not only to the structure and pragmatic functioning of Iatmul culture but also to its ethos From this it may be inferred that the book is written for anthropologists, and that some knowledge of this science is necessary for its proper appreciation



The Archaeology of Sussex by Dr E CECIL CURWEN is a further addition to Methuen's series of county archaeologies under the general editorship of Mr T D Kendrick of the British Museum Dr Curwen regards Sussex as a microcosm peculiarly suitable as a subject of regional archaeological study He states that until recently London's week end playground of to day was separated from the North by a barrier of clay land and forest Even as lately as 1818 Bishop Buckner advised the new curate of Waldron to take up residence before the onset of winter or risk an indefinite postponement of arrival The book opens with a chapter on archaeological methods Aerial photography has produced striking results By this means ancient sites may be delineated through the medium of standing corn which grows more richly over the greater depth of fertile soil covering prehistoric pits and ditches In excavation it is almost as improper for an inexperienced person to dig into an ancient site as it would be for such a person to perform a surgical operation Dr Curwen traces the history of Sussex from its earliest beginnings to Roman times correlating such famous county antiquities as the Piltdown Skull Chanctonbury Ring Cissbury, and Anderida with their appropriate periods As a doctor in active practice the author is to be congratulated on writing a book which shows evidence of remarkable industry and scholarship It is profusely illustrated and it should be a source of profit and pleasure to all who are interested in archaeology or who are acquainted with Sussex The price is 12s 6d

Preparations and Appliances

AN ANAESTHETIC AIRWAY CAP

Mr HERBERT CHARLES anæsthetist at Royal Masonic Hospital writes

The upper figure illustrates a metal cap for use where continuous gas or gas-oxygen-ether administration is required By means of two spring clips it can be attached to any ordinary flat topped airway and so bring the hole in the cap into position with that of the airway whichever size of airway is used The centre part with projecting arm is made to revolve so that this can be used in any position The top plate in which there is an oblong opening is also movable so that by twisting it round this opening can be made to coincide with a similar opening in the plate beneath and air admitted as required

The rubber flange illustrated is of soft rubber 3/32 in thick and when in position as in diagram is tucked inside the lips to prevent the escape of gases or air around the airway The flanges are made in three sizes suitable for men women and children the sizes being roughly 9 by 5 cm 7·5 by 4 cm 6·5 by 3·75 cm and the hole in the centre 1·5 1·25 1 cm respectively The hole being round causes the flange to curve downwards this corresponds better to the shape of the mouth and keeps more easily in position

The lower two figures show the metal part of an airway with a short telescopic slide which can be lengthened or shortened according to the length of airway required This saves the necessity of carrying several two or three being ample—one for children and the others for adults

Both appliances are manufactured by Messrs A Charles King Ltd

Illustrative Cases

In one of my patients who had a hypersensitivity towards dog's hair a mask protecting the conjunctivae and nose alone, with the mouth unprotected, prevented the onset of an attack of asthma. I was able to prove in the same case that the protection afforded by filtration apparatus and a mask was only of use so long as the filter remained in operation. As soon as the filter was replaced by a dummy, exposure to dog's hair was followed by an immediate attack of asthma. This result being obtained in a patient who believed herself to be protected is a proof that the asthma was actually produced by the allergen and that no protection was afforded by a mere psychological factor. There are, however, only a small number of patients in whom the intake of an allergen is immediately followed by the production of obvious allergic symptoms.

Another patient, who had observed that his attacks always occurred after eating a certain variety of pears, had an attack in hospital after eating such pears and at the same time gave a tremendous skin reaction on being injected with a small quantity of pear extract. Such specific cases are rare but characteristic, and they afford a reliable proof of the specific role of the allergen.

In another patient the history suggested that the onset of his attacks dated from the time he began work as a furrier. The skin tests in the case showed however, that he had a marked hypersensitivity towards bed feathers, and his condition was immediately cured by removal of feathers from his bedding.

Although the history was misleading in this instance I still believe that in most cases, especially where skin tests give inconclusive results it is of the greatest importance to employ the history as a guide in the choice of allergens that should be used in testing and for the interpretation of the results. A positive skin test, whether obtained by the cutaneous or intracutaneous method, should exhibit a marked wheal with a surrounding inflammatory zone which may be as large as a halfpenny or even larger, and which may or may not be accompanied by other distant or general allergic symptoms. Where specific reactions are expected, as in hay fever, it is desirable that only the cutaneous method of skin testing should be used in order to avoid disagreeable symptoms.

I have recently shown that the area of a reaction becomes, for the few hours following its appearance, insensitive to the injection of other allergens, but not to that of a solution of peptone. I would hesitate however, to conclude from these observations that in all these allergens the same substance is responsible for the reaction. This has been said of the hay-fever allergens derived from many types of pollen and it has for this reason been maintained that it is sufficient to carry out desensitization with only one or at most a few pollens and that this technique gives the same results as the use of individual extracts. My own experience, however, does not support this conclusion, as the following case shows.

A boy aged 15 years had suffered from a "status asthmaticus" from 1931 to 1933 in all parts of Europe both in low lying country and in the mountains. Skin tests showed him to be hypersensitive towards *Festuca rubra Dactylis glomerata Lolium perenne Cerale cereale Triticum vulgare Trisetum florescc Agrostis canina* and *Elymus gigantes*. After a course of injections in 1934 he had a few attacks of rhinitis but no asthma during the hay fever season of that year. During the next year the three last allergens were found no longer to give skin reactions and reactions to all the others except *Festuca rubra* and *Cerale cereale* were diminished. A fresh course of injections with a new mixture which included Timothy grass (*Phleum pratense*)—although this was negative in skin tests—and *Alopecurus pratensis* was given and although 1935 was a particularly bad season for hay fever sufferers complete freedom has been enjoyed during the subsequent two years.

Most allergic patients do not show the markedly specific reactions obtained in hay fever, and tend to react with an assortment of allergens. In such, comparison with a carbol-saline control and the comparison of the various tests, together with the history of the patient gives a certain guide in the judgement of the tests. But these reactions cannot be considered to be as reliable as the marked reactions mentioned above, and much experience and judgement is necessary for their correct interpretation. It must be remembered that bacterial allergens usually produce reactions after much longer intervals (up to as long as twenty-four hours), which can perhaps be explained as being due to the same mechanism as that responsible for Shwartzmann's phenomenon or to a similar one.

Another specific test that is perhaps too complicated to be employed for general purposes is the Prausnitz Kuestner reaction in which the passive transmission of the hypersensitivity from an allergic patient to a normal person is secured by means of an injection of the affected person's blood serum. The hypersensitivity, which is purely local, occurs at the site of the injection after a few hours. In some instances eosinophilia was of use in diagnosis as in nearly 50 per cent of the allergic cases there is an eosinophilia of the blood of over 5 per cent, and in one of my asthma cases the eosinophilia was as high as 53 per cent.

Clinical Experience

Up to the present time my experience comprises about 800 allergic cases. 200 of these were observed a few years ago in the Charité Hospital in Berlin, and the remaining 600 in private practice and at certain other hospitals. Most of these cases were asthmatic, but a part of them were cases of hay fever and other allergic diseases including vasomotor rhinitis, Quincke's oedema, urticaria, migraine, and mucous colitis. In a survey of 522 asthma cases published in 1934 I found allergic symptoms such as an eosinophilia of over 4 per cent in 221 cases, a family history of allergy in 128, and other allergic symptoms besides asthma in 165. Positive skin tests were obtained in 364. Among the most frequent reactions were those obtained with house dust, which gave 252 positive results. Feather beds and mattresses gave 199 positive results and eighty-four were obtained with extracts of moulds cultured from allergic surroundings. Bacterial extracts gave positive results in 108 cases, animal fur in forty two, and other allergens in fifty-five. The majority of cases gave positive results with more than one allergen.

In a previous paper in this *Journal* I discussed the part played by active and inactive tuberculosis in the course of allergic complaints. The role of infections in general and of tuberculosis in particular may be the same as that of any other sensitization, this being produced by the protein of the infecting organism. It may however, prepare a special part of the body such as the bronchial mucous membrane, and in tuberculosis the lymphatics and/or the lung tissue or streptococcal infections the antrum so that their threshold is lowered towards the entrance of other allergens. On the other hand, I have observed that cases of inactive tuberculous infection have flared up subsequent to or because of desensitization with other allergens. I have also drawn attention to some patients who with all the symptoms of a true bronchial asthma prove to have active and open tuberculosis. For this reason it is in my opinion, essential to examine the sputum for tubercle bacilli and to perform an x-ray examination of the chest as a routine in all asthma cases. In this way diagnostic errors, such as the overlooking of a bronchiectatic condition of the lung substernal goitre and other diseases will be avoided. *X*-ray examination of the nasal sinuses

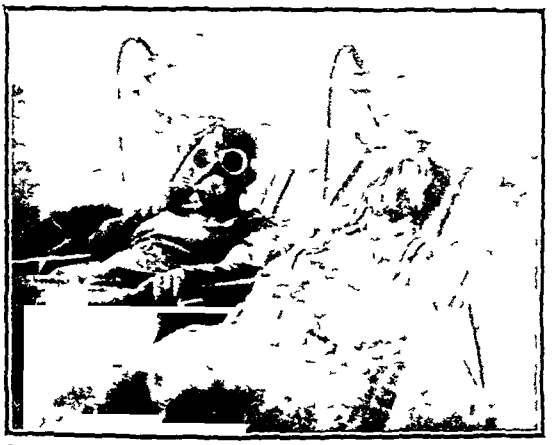
MEDICINE AND THE FACTORIES BILL

The discussions within and without Parliament regarding the new Factories Bill reveal a significant change of attitude on the part of the public Despite its shortcomings the Bill has served to show that it is now generally accepted that health is a function of economic life and that the maintenance of health entails the closest co operation of many diverse interests There are certain matters that from a medical standpoint we would wish to see amended in the Bill, others that can be corrected by such Orders as the Secretary of State will be empowered to make Rule by the Executive, as distinct from legislation by Parliament, may have many drawbacks and dangers The Lord Chief Justice has pointed these out from time to time, and we are not blind to the serious defects of this method of government It is, however, difficult to see how, in the absence of this more elastic system, codes can ever be devised to meet the rapidly changing conditions such as are presented by modern industrial technique The obvious moral to be drawn is that legislation is no substitute for education The operation of this measure will depend not only on the wisdom of Parliament, but on the influences that are brought to bear on the Secretary of State, H M inspectors, employers, workers, and medical men and women Given a good framework, which we hope this Bill will provide, the need for a fuller, wider and developing social conscience, and a deepening knowledge of the relevant facts, will grow in the future On the whole we have to admit that the method of rule by Order as envisaged so fundamentally in the Factories Bill is the only way to keep the code abreast of the changing needs of the time

Our profession has heavy responsibilities under this Bill, and we must see to it that from the start of medical education the student's mind is kept alive to the economic and industrial aspects of his professional work On the physical and psychological sides of clinical medicine in everyday practice industrial and occupational factors figure largely Within industry doctors are called on to adjudicate and advise, and therefore they must be prepared to understand more clearly than hitherto what are the basic desiderata of healthy life in industry

To start this new campaign with as few obstacles as possible we would wish the Bill amended in certain important particulars Many had hoped to see the total abolition of overtime for young persons, and provision made for educational facilities with pay We regret that the age of entry is not raised to 15, because it seems that this omission nullifies the recent legislation which apparently raised the school-leaving age to that level We believe, further, that young persons need a proper holiday every year, and that the labour of adolescents can hardly be so vital to industry that the provision of fourteen days' holiday with pay would prove unworkable In point of fact it is sound economics and should be enforced Everyone ought to have an annual holiday, but certainly adolescents need it as a factor in healthy growth and development We trust that in the committee stage pregnant and post-parturient women will receive the consideration that we know to be necessary if healthy babies are to be born to healthy and unfatigued mothers The safety clauses in the Bill are sound, but accidents will still happen It is urgently necessary that the whole standard of first-aid should therefore be raised It is still very badly done in large sections of industry, and should be subject to a new and strict clause All first-aid arrangements require medical supervision and approval

The many excellent features of the Factories Bill deserve praise Our object, however, is not to dispense laurel wreaths at this stage, but rather to use our influence to achieve amendments in the next few weeks which will make this a really good piece of legislation Now, therefore, is the time for constructive criticism With the main clauses of the Bill many readers will by now be familiar through the outline given on February 13 at page 367, and a report of the second reading debate in the House of Commons appears in our Parliamentary Notes to-day



Washing arrangements should be statutory and not merely subject to special Order Women should not be classed with young persons but should receive the different treatment that biological reality and human dignity demand Canteen arrangements could with advantage receive full mention and be made more comprehensive and something should be done to impose on employers who put their works in the country or far from the main centres of population an obligation to ensure certain standards of transport and to adjust hours to meet the reasonable needs of the worker The provision of civilized conditions of work has been shown to be not a luxury for large firms but an economic asset, and no one, therefore, should assume that decent and humane standards are

seems to be of particular importance not only in asthma but more especially in vasomotor rhinitis and old foci in the antrum may be responsible for the exacerbation of symptoms in operations on the nose

Treatment and Prophylaxis

It is clear that treatment of allergic conditions especially of asthma can and must start from several different aspects When the specific allergen is the outstanding factor the discovery and removal of it may be followed by complete recovery It may be very easy in one case and impossible in another

As the complete range of allergens that are responsible can rarely be discovered in any one case, I make use of those specific allergens that have been detected mixed together with either peptone or small quantities of old tuberculin Such a mixture is of great use in the treatment of a case in which any doubt remains as to the identity of all the responsible allergens The treatment begins with a dose of a dilution that has been found by means of titration in skin tests to be considerably smaller than the smallest quantity producing a skin reaction The course of injections covering a period of ten to twelve weeks, should consist of doses of increasing size, and

The mask type of allergen filtration apparatus connected to a high pressure air supply in horizontal pipe behind chairs

should not in any way be interrupted Should, as the doses are increased, a severe reaction occur the addition of 0 25 c cm of adrenaline 1 in 1,000 and/or the reduction of the quantity of the next dose to that of the preceding one will in most cases allow treatment to be continued I have always tried to begin treatment in allergen-free surroundings For hay fever it is usual to begin and finish the treatment before the start of the hay fever season With house allergens such surroundings may be obtained by means of an allergen filter apparatus (see figure)—mask, sleeping bag or cubicle—or by the careful removal of feathers and dust In instances of food allergy the necessary conditions are obtainable by means of a special diet

As has been shown before the majority of cases in adults as well as in children are due to a hypersensitivity towards house allergens Those next most responsible are the bacterial allergens and I think it is for this reason that some asthma patients respond to vaccine treatment. The efficacy of such treatment depends very largely on the choice of the correct dose on the type of bacterial vaccine and on the time interval and the length of treatment I prefer to use autogenous bacterial allergens until the patient has acquired a high degree of desensitization and consequent immunity

Summary

The 'threshold towards the allergen varies not only in different persons but in the same person at different periods of life and under different conditions

Hypersensitivity is consequently a variable factor not only in general but also in particular localized areas

Thirdly, one has in these conditions to deal with a variety of causes changing the threshold of hypersensitivity Treatment consists in dealing with septic foci endocrine and metabolic changes special physical conditions of the upper respiratory tract and chest wall and with psychological factors influencing the sympathetic nervous system

POST-HYSTERECTOMY AND PUERPERAL TETANUS

A STUDY OF THE BACTERIOLOGY OF OBSTETRICAL AND GYNAECOLOGICAL DRESSINGS*

BY

R J V PULVERTAFT, M D, M R C P
Reader in Pathology University of London

The experiments related in this paper were undertaken to discover why a specific case of tetanus developed after hysterectomy and they were extended to establish the reason why post operative tetanus is peculiarly related to hysterectomy It was apparent as a result that the dressings used before the operation contained tetanus spores and other anaerobic spore bearing pathogens, they were made of 'cellulose wadding

Study of a Case

The clinical features of the case were as follows

A woman of 51 suffered from intermittent loss of blood per vaginam At operation an endometrioma of the posterior uterine wall was found attached to the pelvic colon Total hysterectomy and bilateral salpingo oophorectomy were performed Four days later tonsillitis developed and seven days later trismus with spasms on deglutition A diagnosis of tetanus was made by two clinicians experienced in the condition She died twelve days after the operation

At the post mortem examination the operation site was found in fair condition although less union of tissue was present than normal there was no definite naked-eye sepsis The spleen was soft and diffluent little evidence of tonsillitis was found and nothing explaining death.

Material from the wound site was collected and also a sample of faeces The tissue cultures yielded morphologically typical tetanus bacilli and spores the faeces did not A guinea pig injected with a mixed culture died with signs of tetanus

The catgut used at the operation had also been used on the same day on two other cases which had a normal con

imposition If a firm cannot employ people properly, better that it should not employ them at all, and we would urge that at any rate in essentials the best industrial practice should be made standard by law, departures therefrom being allowed only in rare instances, for a limited time, and in special circumstances, by the Secretary of State In the end the community would benefit and, as has been the experience in the past, the "awful economic consequences" of imposing good social conditions would prove to be illusory

Rheumatism and respiratory diseases take a terrible toll of human efficiency and happiness It is therefore necessary that these subjects should receive fuller mention in the Bill Everyone should be able to wash when leaving work, and during working hours outdoor clothing should be so disposed that it will be dry when put on again Wet outdoor shoes require proper cupboards, and working kit needs airing and drying during the night. Clauses 41 and 42 ought therefore to be made general and universal and not merely applicable to workers on prescribed processes Those who work in exposed places need proper waterproof overalls and the small cost of these would be offset by a great reduction of sickness The worker ought not to be expected to bear the cost of special kit to keep him or her dry and comfortable in a wet, exposed, or cold occupation The care maintenance, and disinfection of respirators should be a task imposed on a single official in every factory where such apparatus is required It is inadequate to supply protective clothing and apparatus unless it is the duty of some one person to take care of this equipment and see that it is used correctly The time has also come to standardize stretchers and ambulance equipment, so that any risk of having to transfer patients in course of transit may be avoided A single clause could effect this very necessary reform within a few years While there are admitted difficulties in the universal adoption of a five-day working week, the premium and privileges outlined in the Bill in favour of those who adopt it are most commendable They should result in a substantial increase in the number of such schemes The long week-end is of the utmost value and results in better health better work and let it not be forgotten, increased consumption of goods and hence an additional benefit to productive industry

This Bill is very welcome Let us see to it that it becomes an even better Act by reason of improvements in committee The good will and help of all parties will not have been misplaced if they make a real contribution to the nation's health We close on a note of warning Legislation is no substitute for the voluntary co operative efforts of an enlightened people Education in industrial health must go on more energetically than ever, and we must remember that good health is but a facet of the economic and social life of a people and depends in the last resort on the general level of its technical and cultural education and insight

THE INFLUENZA EPIDEMIC

The influenza epidemic of 1936–7 has run its expected course, and there is little to be learned from it except that we are still largely ignorant both of the reasons why the disease should suddenly assume epidemic proportions and of the associated bacteriological problems Bacteriologists have made and will continue to make every effort to isolate the offending agent be it virus or bacillus or a combination of the two, it is to be hoped that epidemiologists will in time be able to adduce reasons for the apparently capricious nature of the epidemic manifestations We would suggest that a careful comparative study of the meteorological conditions obtaining in epidemic and non-epidemic periods might throw some light on the prevailing darkness The doctrine that such outbreaks are due to the increase in the number of susceptibles in the inter-epidemic years and that the incidence only falls when the supply of susceptibles is exhausted does not furnish such a satisfactory answer as it does in measles There appear to be definite variations in individual susceptibility and any immunity which develops is inconstant and transient There must be some undiscovered factor which either activates a normally harmless organism or lessens the usual body resistance

Influenza not being a notifiable disease we can only estimate the total number of cases and the rate and direction of the spread of the outbreak by the return of deaths and of primary or influenzal pneumonia Neither of these figures necessarily gives a true picture of the incidence of a disease in which death and serious complications have not been an outstanding feature, but the table given below may be taken as a fairly accurate indication

The deaths in the seven weeks of real epidemic prevalence in London and in the 122 great towns were 1,361 and 6,158 respectively in the corresponding period during the 1933 outbreak the figures were 1,802 and 9,092 The forecast made in our issue of January 16 that the epidemic would be less severe than that of 1933 has therefore been justified Generally speaking it is evident that the South Eastern area and London were affected first and that the spread was to the Midlands and the North Judging from reports from these areas the dislocation of trade and other activities consequent on the epidemic were even more pronounced in

valescence A sample was tested and gave no aerobic or anaerobic growth It was reissued for general use, and the whole batch a large one, was used over a period of months with no untoward results

Attention was then directed to the dressings After operation the vulval pads used were made of cotton wool autoclaved according to a routine found satisfactory by test No organisms were found in sampling a typical dressing tin Before operation, however a pad of unsterilized cellulose wadding had been used A specimen was taken and placed in a wide mouthed jar boiling broth was poured on to it, and the culture was examined after seventy two hours Morphologically typical tetanus bacilli were found, the culture was purified by subculture, and on injection into mice typical tetanus developed

The position, therefore, was that a woman not harbouring tetanus spores in her faeces developed tetanus after an operation in which catgut was almost certainly not to blame, and that the pads employed prior to operation were conclusively shown to contain tetanus spores It would scarcely be possible to obtain a better *a priori* case for the aetiology of this particular tragedy

Consideration of the Literature

An admirable account of the literature of catgut tetanus is given by Dalrymple Champneys The difficulty of proving a chain of events which had their origin some days or weeks back is obvious, the specific catgut used is rarely if ever obtainable, and it is not surprising that proof of the contamination is rarely to hand Although the material used is made from the relatively sterile small intestines of lambs, it is obviously a possible cause of post operative tetanus But there are a very large number of other possible sources, tetanus spores are everywhere There are, indeed strong reasons to suppose that post-operative tetanus is due most often to causes other than catgut

In the first place, if catgut were to blame as a rule we should expect a general operative incidence, or perhaps an incidence varying only with the amount of catgut used But, broadly considered tetanus is found to follow minor operations where no catgut is used more often than major operations involving much catgut Such conditions as tetanus neonatorum due to the knife used, tetanus following vaccination and corn cutting due to the dressings, and a series recently reported by Godwin where several cases after circumcision were found to be due to dressings applied by a Cypriot quack indicate that it is unreasonable to blame catgut, in whose preparation at least some care is taken rather than dressings and apparatus, in whose preparation far less care is taken

The observation that post-operative tetanus has a peculiar incidence following hysterectomy was made by Hildes who stressed the difficulty of proving a relationship between the catgut used and the infection He quoted cases recorded by Koch Audebert and Dyke Four further cases have been reported to me privately

Apart from cases following hysterectomy a large number of cases after abortion either criminal or natural, and after childbirth are recorded Le Doze collected nineteen cases of puerperal tetanus and stated that puerperal tetanus accounted for 3·5 per cent of all cases of tetanus The literature of tetanus has recently abounded in references to this condition, cases have for example, been recorded by Rossi and Bernardbeig Moreover, the female genital tract is a possible source of contamination in tetanus neonatorum and the case of tetanus developing after rupture of prepuce in coitus recorded by Kuzmin may perhaps have been of similar aetiology The importance of the condition in obstetrical and gynaecological practice must not, however, be exaggerated Reference to the literature indicates its development after compound fractures where the dressings or direct wound contamination by dirt may be the cause after operations on the gut, where the organism is possibly derived from the faeces and after extraction of teeth In the case of dental extractions again, the possibility of infection from the plug inserted into the socket must not be overlooked, although tetanus bacilli have been grown from saliva Enough has however, been said to show that tetanus is a disease sooner or later likely to bring itself to the attention of gynaecologists and obstetricians and that any explanation of its development in such practice deserves consideration on its merits

Tetanus Spores in Cellulose Wadding

The discovery of the unsuspected presence of tetanus spores in cellulose wadding dressings was made by Hildes, and two cases developing in orthopaedic practice from splints packed with this were described by him at a meeting of the Pathological Section of the Royal Society of Medicine in 1935 The cases were not published The technique used by him makes the isolation of tetanus, previously difficult, exceedingly simple Cellulose wadding produces a "reduction potential" which makes anaerobic culture easy without further elaboration and the climbing properties on agar slopes of the organism render purification again a simple matter No other anaerobe is so easily obtained pure

In view of the apparent relationship of the case here described to "sanitary towels," a number of different types of British make were examined They were made of bleached or unbleached, coloured or non-coloured cellulose wadding, or of cotton-wool, or of mixtures of both Some were advertised as hygienic, aseptic, or antiseptic No British towel is actually sold with a guarantee of sterility, though some have a vague certificate

It is difficult for the pathologist to see any difference of importance between the various makes, though of course the wearer may find preferences

Results of Cultures

The results of anaerobic cultures are tabulated below It will be seen that *Cl tetani* and *Cl welchii* are consistently present, and that in some cases death from tetanus followed in mice injected In many cases mild tetanus developed, but the mice recovered

monia of the severe toxic or "heliotrope" type so common in 1918 were very rarely seen Clinically the disease has been generally mild the onset has usually been sudden with malaise accompanied by headache, backache, laryngitis, and tracheitis as the most constant features A temperature range of 99° to 103° has been the rule, pyrexia usually persisting for forty-eight hours A painful dry cough in the early stages followed by varying degrees of catarrh has been common Marked prostration has as a rule followed, and few patients have been really fit in less than a week, the majority feeling "washed out" for considerably longer Pains of a neuralgic type in the scalp have often persisted It is probable that we shall not have a further visitation on the same scale for at least two years, and it is to be hoped that before then further facts as to causation and spread will be forthcoming

CHEMOTHERAPY OF STREPTOCOCCAL INFECTIONS

We described not long ago the very striking developments which have followed the introduction of 'prontosil' as a remedy for streptococcal infections That the action of the drug is not direct but due to the formation in the body of para-aminobenzene sulphonamide is now certain and future treatment is likely to be conducted mainly with this substance itself It will be remembered that Colebrook and Kenny,[1] in reporting a second series of twenty-six cases of puerperal sepsis, all of which recovered after treatment with prontosil, announced their intention of treating such cases at Queen Charlotte's Hospital in future with "sulphonamide" only. In this issue will be found a report on the same subject by Foulis and Barr, who have treated eighteen cases of puerperal sepsis with sulphonamide only and four others with a combination of sulphonamide and prontosil These cases were chosen for their severity, the majority being either septicaemic or suffering from peritonitis, yet there was only one death in the series These results are of importance not only in confirming the expected efficacy of sulphonamide itself but in indicating to what lengths heavy dosage can be carried without apparent ill effect of any consequence As is to be expected, the literature of this subject is growing rapidly, and several recent papers contribute something to present knowledge of it Tréfouel, Nitti, and Bovet,[2] who were responsible for the discovery that prontosil becomes bactericidal only when converted into sulphonamide, have now synthesized no fewer than 116 compounds related to the latter, and tested their therapeutic efficiency in mice, without finding any which is superior or indeed apparently equal to sulphonamide itself, although twenty-eight showed some activity This study is of considerable interest in clearing the ground and in relating chemical structure to bactericidal efficiency Another experimental study of some interest is that reported by Berger,[3] who varied the usual procedure in mice by injecting virulent streptococcus culture subcutaneously instead of into the peritoneal cavity The administration of prontosil by the mouth five hours later limited the spread of the infection and saved the life of the mouse, but even when culture and drug were given simultaneously the development of a local abscess could not always be prevented This observation strengthens an impression gained from other work that these compounds act much more on streptococci freely circulating in the blood and other body fluids than on those still confined to the original lesion There is still much to be done in determining how far, if at all, susceptibility to this treatment depends on the site of the infection and the type of lesion produced One of the first clinical reports from the U S A, by Long and Bliss,[4] registers distinct but somewhat guarded approval of the results obtained in nineteen cases of which five had erysipelas, six scarlet fever or severe throat infections, three wound infections, two otitis media with complications, two uterine sepsis, and one impetigo These conditions fairly represent the manifold activities of the haemolytic streptococcus, and the reaction of each of them to this treatment merits extended and critical study Two other recent papers carry these investigations into new fields and remind us that the anti-bacterial activity of prontosil and sulphonamide is not entirely confined to one organism, although such investigations as have been pursued hitherto have revealed no other which is equally susceptible and some which for practical purposes are indifferent to it Huber[5] claims by treatment with

In France several brands of towel are sold with vague rtificates of sterility one type was found with a clearly rased guarantee specifying the autoclave temperature he results of cultures were as follows

o	Composition of Towel	Description of Towel	Anaerobic Bacteria	Litmus Milk	Mice Tests
	White cotton wool	Aseptic and Ant septic	Cl welchii	Acid stormclot	Slight spasm Negative
	White cellulose wool Coloured	Aseptic	Cl tetani Cl sporogenes	Acid	Negative
	White cotton wool	A eptic and Antiseptic Sterilized 130 C	Cl tetani Cl welchii	Acid stormclot	Negative

No	Aerobic Bacteria	B Coli Test
7	Coliform bacilli	Positive
8	Haemolytic staphylococci	Negative
9	Coliform bacilli B subtilis	Negative

In America greater importance is attached to sterility f towels and one at least is sold with a specific guarantee f sterility It is a tampon of white cotton wool which es in the vagina It was the only towel examined which roved sterile No towel" of this vaginal type is sold a Great Britain, though, of course, dancers among others se such methods of absorbing menstrual flow

lo	Composition of Towel	Description	Anaerobic Bacteria	Litmus Milk
16	White cotton wool	American Nil	Nil	Sterile
			Aerobic Bacteria	B Coli Test
16	"		Nil	Negative

An accouchement set put up by a reputable maker was next examined It was, of course, sold as sterile The superficial wool was charred suggesting that dry heat was used for sterilization Results were as follows The anaerobic staphylococci may be neglected they were probably introduced during culture

Sterile Accouchement Set

No	Composition of Material	Description of Material	Anaerobic Cultures	Litmus Milk	Mice Tests
X	Brown and white cotton wool towel	Sterile	Cl tetani Cl sporogenes	Acid	Slight spasm
Y	Brown cotton wool		Staphylococci B subtilis	No change	Negative
Z	White cotton wool		Staphylococci B subtilis	No change	Negative
			Aerobic Cultures	B Coli Te is	
X	Ditto		Sterile	Negative	
Y	Ditto	"	S subtilis	Negative	
Z	Ditto		Sterile	Negative	

An accouchement set was next arbitrarily selected from the labour ward of a general hospital The vulval pads were made of cellulose wadding When cultured they were found sterile

A similar set sold by a private firm and issued under strict supervision and regular bacteriological test by an enlightened medical officer of health in London was next examined It had a closely fitting lid which is often not the case All the pads were made of cotton wool Three out of four were sterile *B subtilis* was obtained in one case, almost certainly a cultural contamination The practice of this medical officer of health appears not to be universal, in some districts at least no control or supervision of accouchement sets exists

It would appear from these findings that cellulose wadding is peculiarly apt, as Fildes showed, to harbour anaerobic spores The reason is not obvious, since cotton wool also consists of cellulose

The method of manufacture of cellulose wadding is as follows

1 Selected tree trunks mainly red spruce and pine are mechanically ground into chippings and then heated under pressure in an autoclave at a temperature of above 100 C with a strong aqueous solution of sodium hydrogen sulphite containing an excess of sulphur dioxide This treatment converts the lignin into lignone sulphonic acid which, being soluble in water is removed by washing leaving behind the pure cellulose The latter is then suspended in water bleached with strong calcium hypochlorite solution and then run out on a machine and converted into fairly thick boards

2 The sulphite wood pulp is taken as required macerated with water in a beating engine until it disintegrates into its constituent fibres and then treated again with calcium or sodium hypochlorite solution The pulp is then diluted with water and run on to a machine where it is made into plied wadding

These processes would be calculated to kill any spores and in fact material after stage 1 and stage 2 was found free from *Cl tetani* and *Cl welchii* by bacteriological tests The contamination therefore follows later

Measurement of the electrical charge and rate of leak by a Lindeman electrometer did not show a material difference between cotton wool and cellulose wadding nor does either of them attract lycopodium when rubbed with vulcanite or other rods A sterilized pad hung up in a room for seven days was not found on later culture

prontosil to have brought about rapid cure in acute *B coli* infections of the urinary tract in children and Rosenthal[6] finds that sulphonamide given subcutaneously in oil protects against pneumococcal infections in mice Although doubtless other uses for this drug will be found, the principal task which remains is to define in detail the conditions of its utility in infections by streptococci and to this study everyone in practice is capable of making some contribution

INTERMITTENT CLAUDICATION

Over a hundred years ago Boulay a French veterinary surgeon described a malady in the horse characterized by the development of lameness in one or both hind limbs after a certain amount of exercise the condition occurred in animals in which the main artery to the affected limb was obliterated Fifteen years later a similar condition was described in man by Brodie and by Charcot and it was established that the lameness was due to pain in the affected limb the pain developing with exercise and disappearing with rest. Many ideas were put forward concerning the nature of this pain but no attempt was made to provide more than circumstantial evidence until the condition was investigated experimentally in man by MacWilliam and Webster in 1923[1] and more completely by Lewis, Pickering and Rothschild in 1931 The latter authors showed that the pain is due to stimulation of the pain nerve endings (thought on experimental grounds to lie in the tissue spaces around the muscle fibres) by the action of some chemical substance released from the muscle fibre during and in proportion to its contraction In ordinary circumstances this substance is removed so quickly by the circulating blood that even in severe exercise pain does not occur when however the circulation to the muscles is deficient the substance accumulates during exercise to a level sufficient to give rise to pain In diseased subjects the amount of exercise necessary to produce pain in any group of muscles is thus a useful index of the extent to which their blood supply is curtailed Several workers particularly in America have since confirmed the observations on which these conclusions were based and have sought to define more closely the nature of the chemical substance causing the pain One major fact has emerged—namely that the pain-producing substance is one which is chiefly removed from the muscles by oxidation for even when the blood supply to the muscle is unimpaired exercise of a limb may be associated with pain if the oxygen content of the inspired air is sufficiently low,[3] or if the oxygen carrying power of the blood is greatly diminished, as in patients with severe anaemia[4] The pain producing substance thus seems to be a normal product of muscular contraction which diffuses readily and is easily oxidized Elliot and Evans[5] have recently pointed out that lactic acid fulfils these requirements and describe experiments devised to test the supposition that it is the accumulation of this substance in exercised ischaemic muscles which causes pain They argue that if this hypothesis is correct then any procedure which increases the blood lactic acid should diminish the amount of exercise needed to bring about pain in the arm whose circulation is arrested They sum up their results as follows

'Lactic acidaemia, as brought about by exercise (of the legs) epinephrine, or the introduction of sodium lactate into the body was regularly accompanied by an earlier appearance of ischaemic pain in the muscles of the forearm In most experiments this effect outlasted the rise in blood lactic acid content but in no instance did exercise tolerance return to normal in the face of continuing lactic acidaemia The converse of this was not always true—namely decreased forearm exercise tolerance often occurred without rise in blood lactic acid

As the concentration of lactic acid in muscle must be determined by factors other than the lactic acid content of venous blood these discrepancies do not invalidate the hypothesis which their main observations support—namely that ischaemic muscular pain is determined by the local concentration of lactic acid It may be noted in passing that these authors found the ingestion of 100 grammes of glucose or the injection of 20 units of insulin increased exercise tolerance in the ischaemic arm observations which may yet be found to have their clinical counterpart in the behaviour of intermittent claudication and angina pectoris in diabetic subjects

ARTHRITIS IN WOMEN

In a pamphlet based on a lecture delivered last year[1] Dr Fortescue Fox discusses *arthritis in women* He draws attention to the widespread disabling effects of chronic rheumatism at all ages and to the fact that the disease attacks women much more frequently than men This is especially the case in the more serious variety rheumatoid arthritis which is all the more important since it strikes down the adolescent and young women both married and single in the hey day of their productive and reproductive life The other two varieties of arthritis described by Dr Fox the climacteric and osteo arthritic occurring in middle and old age are not so devastating in their effects sociologically but none the less very distressing to the individual Emphasis is laid on the point that arthritis probably never attacks the completely healthy person and that the lowered resistance is at least as important as the invading or coexisting micro organism This lowered resistance is probably partly inherent and partly acquired and the conditions determining this require further study In considering treatment two factors must be weighed first that if it is to be effective at all it must be applied during the early stages and in consequence better ascertainment is desirable and secondly that treatment will have to be continued for a long period For this latter purpose as in the case of tuberculosis some sort of sanatorium or rest home is necessary especially for the young women afflicted by this disease It a philanthropic person were to start such an institution it is certain that its usefulness would soon become so

to contain either *Cl tetani* or *Cl welchii*, whether its composition was cellulose wadding or cotton-wool However cellulose wadding is known to have characteristics which make it peculiarly useful in industry, it is used in filtering solutions in artificial silk manufacture, and in gas masks, where cotton-wool is much inferior The characteristics which make it of value in industry render its use, unsterilized, dangerous in medicine

Discussion of Results

There is a danger that results such as those here described may be given grossly exaggerated importance Tetanus spores are everywhere, and in this work such things as artificial and real silk handkerchiefs were found to contain them It is not the presence of the spores but the use which is made of the products containing them which matters No one has ever contracted or is ever likely to contract tetanus during the use in menstruation of these towels Equally obviously, they should not be used before or after parturition or pelvic operations, even if they have been "sterilized"

Certain considerations, however, present themselves to a pathologist who studies for the first time the apparently neglected subject of the "hygiene of menstruation," and the "accouchement set" Sanitary towels are a recent development of civilization They are not towels, are they sanitary? Is it really desirable to retain the menstrual flow at the vulva, particularly in pads apparently selectively impregnated with most of the better-known anaerobic and aerobic pathogens? Does this increase the "carrier rate" of the individual, and even if tetanus is a curiosity in the puerperium or after operation, is *welchii* infection so rare? Can women become carriers of virulent streptococci from this source, especially since so many women wear pads during pregnancy? Is the American technique of the sterile vaginal tampon preferable, whatever its aesthetic or other objections?

Moreover, it certainly seems strange that in these days of extreme care in the management of the puerperium no regulations exist for the sterilization or control of accouchement sets A patient who contracts a *welchii* infection will get a serum which must comply with elaborate regulations, but the dressing which gave her the infection need comply with none Yet the necessary regulations are few autoclaving and occasional bacteriological testing are all that is needed At present the sale of a tin of sardines is the subject of more official control than a tin of accouchement dressings All the resources of preventive medicine are making little impression on the incidence of puerperal infection The aboriginal, who uses no menstrual pad and no accouchement dressing tin, is safer from infection than her civilized sister

It is not intended to exaggerate the importance of these views there are unfortunately only too many known ways in which infection may occur in pregnancy It is just possible, however, that changes in the hygiene of menstruation and more care in sterilization of dressings might be of benefit

Technique of Examination

The bacteriological examination of a large object such as a vulval pad presents many difficulties Spore-bearing organisms are of course very numerous in the air and are apt to adhere to the pad during manipulation Moreover, where wide mouthed jars are used in culture, spores may drop in during manipulation, or might even survive in a cotton wool plug after autoclaving Control tests were therefore done with pads known to contain tetanus spores, and pads were autoclaved, impregnated with *Cl sporogenes*, which has a typical morphology and agglaved and then cultured To avoid the risk of contamination from unsafe plugs the culture jars were fitted with screw caps

These preliminary control tests showed that autoclaving for fifteen minutes at 130° C killed *Cl tetani*, *Cl sporogenes* in vulval pads

Such objects as the bristles of test tube brushes in the laboratory and the dust of the laboratory floor were found to contain tetanus spores A rigid technique involving the minimum of manipulation was then followed In no case were any pathogenic spore bearing organisms found in material sterilized in the laboratory or the theatre sterilizer of Westminster Hospital

On the other hand *B subtilis* grew, usually after a few of some days in about one control test in four, occasionally *Staphylococcus albus* was grown laboratory air, filtered through powdered sugar, was found to contain these organisms Even when manipulations are performed behind a glass screen complete sterility difficult to ensure

It is wise, therefore, to examine at least four pads a dressing tin, and to neglect an occasional contamination with staphylococci or *B subtilis* in criticizing an accouchement set

The pad, when placed in a sterilized jar, is immersed covered with boiling lemco broth (about 500 c.cm.) for seventy-two hours Subcultures are made into Robertson medium, and from this subcultures were made into litmus and on to the bottom of a tube of Fildes's medium which should be dry and horny at the top Subcultures are made into Robertson's medium from the horny part of slopes, and after seven days mice are injected Even if animal does not die with signs of tetanus mild cases may recognized by holding the animal up by the tail and pushing a pencil between the hind legs The animal clutches pencil with its legs, but if there be a mild tetanic intoxication the injected leg soon goes into spasm

A storm clot in litmus milk is taken as evidence *Cl welchii*

For aerobic culture pads are soaked in sterile filtered through a sterile Gouch filter, the filtrate is centrifuged and the deposit cultured on appropriate media

It may here be added that pads soaked in lochia have been examined by a similar technique Vast numbers of bacteria in great variety are present, even when pads are sold as impregnated with strong antiseptics however, is a separate problem

My thanks are due to Mr T Wilson senior laboratory assistant Westminster Hospital Medical School for assistance and to Mr L Bresloff for obtaining material the United States of America and from France

On the occasion of the celebration of the centenary the Medical Association of Vienna there will be a festal "week" of medical meetings, receptions excursions in Vienna from May 19 to 29 during addresses will be given by leading authorities in European countries The preliminary programme obtained from the Kursburo der Wiener Medizinischen Fakultat, 4, Alserstrasse, Vienna IX

evident that the authorities would feel themselves justified in extending the scope and number of such treatment centres The International League against Rheumatism, of which Dr Fox is president, performs a useful function in co ordinating rheumatological work, and from all over Europe and North America corroborative details bearing out Dr Fox's conclusions are being received, many of which are quoted in an appendix to this pamphlet Public interest in the serious problem of chronic rheumatic disease is undoubtedly being awakened, but the nation as a whole has done little more than stir in its sleep, and Dr Fox's contribution should help still further to arouse the national conscience

CEREBRO-SPINAL FLUID PRESSURE

The importance of examining the cerebro-spinal fluid in the diagnosis and treatment of organic diseases of the nervous system is now generally recognized Researches on the hydrodynamics of the fluid are opening up a new field of therapy based upon a knowledge of variations in pressure, their causation, and their effects on the brain Most of the work on this subject has been done in the United States, where experimental study of a high order begun by Dandy and by Weed has been followed by that of Pollock and Boshes [1] Both by the ingenious construction of models representing the cerebro-spinal system and by animal experiments these authors have made a noteworthy contribution to the study of variations in pressure of the fluid Their observations on manometry are particularly valuable The cerebro-spinal fluid pressure is usually measured by an "open" manometer, one which allows the atmospheric pressure to act on the subdural contents, the pressure being determined by reading the height to which the fluid is allowed to flow into an open tube on connecting the manometer to a needle inserted into the subdural space This reading is not the absolute pressure before the escape of fluid (as fluid has escaped into the manometer), but the relative pressure In order to obtain the absolute pressure the ordinary practice is to use a "closed" or "bubble" manometer, in which a bubble of air is placed in a glass tube interposed between the manometer and the spinal fluid When the manometer is opened to the pressure of the fluid the bubble is displaced outwards The manometer having been raised until the bubble has returned to its original position the absolute pressure may be measured by the height of the column of fluid in the manometer above the needle in the subdural space Pollock and Boshes use another simpler method which is to let the cerebro-spinal fluid escape into the manometer, and then, by raising the manometer to push the fluid back into the subdural space until the original level at zero is reached The absolute pressure is the height of that point above the needle By means of this method, and by measuring both relative and absolute pressures on models and on dogs Pollock and Boshes conclude that if accurate studies of cerebro spinal fluid pressures are to be undertaken only the absolute pressure should be recorded Experiments on the effect of atmospheric pressure on the circulation of the fluid showed that the cerebro-spinal contents are exposed to atmospheric pressure solely through the blood vessels, and that the difference in the pressure of the cerebro-spinal fluid in the head-down and tail down positions depends on the difference in pressure in the blood vessels in these positions The conception that the cranial contents are encased in a rigid covering is criticized, and Weed's conception of the elasticity of the cerebral coverings is subjected to experimental trial

"RADICULONEURITIS"

The war gave a unique opportunity to those medical men serving with the forces of investigating many rare and ill-defined clinical syndromes in a large number of individuals living under standard conditions Outstanding work was done in neurology both in this country and in France Among the disease entities previously unrecorded were two distinct types of peripheral neuritis The one, acute febrile infective polyneuritis, was described by Gordon Holmes and by Rose Bradford, the other, called "radiculoneuritis" by Guillain, Barre, and Strohl, was later known as the Guillain-Barré syndrome Lately there has been a renewal of interest in this syndrome, as numerous cases have been seen in France Guillain[1] has recently reported ten cases and has re-defined the characteristics of the syndrome It occurs in both sexes during the middle period of life, it is very rare in childhood and in old age He is convinced that the cause of the polyneuritis is a neurotropic virus which becomes actively noxious as the result of some previous infection, usually of the upper respiratory tract Absence of fever forms one of the distinguishing features between this syndrome and that described by Holmes and Bradford Pain, both spontaneous and provoked by pressure on the muscles, is often severe, especially at the onset of the illness Motor weakness, spreading as a rule from the lower to the upper limbs presents all the characteristics of a peripheral neuritis The sphincters are but rarely involved, but paralysis of cranial nerves, particularly of the facial nerve, is not uncommon Abolition of tendon reflexes is the rule, and may persist as the sole remaining sign of the neuritis long after complete clinical recovery The chief distinguishing feature of the syndrome is according to Guillain, the great increase in protein in the cerebro spinal fluid without a corresponding increase in cells He refuses to recognize those cases of polyneuritis which do not show this protein cell dissociation as belonging to the same syndrome He has found it constant in every case, and his observation has been confirmed by others The prognosis is favourable in spite of the initial severe paralysis, and recovery is usually complete within a few months A few fatal cases have, however, been recorded Morsier and Steinmann[2] reported two cases, both with exactly the same clinical picture In one complete recovery ensued in a short time, in the other death occurred from respiratory failure owing to paralysis of the respiratory muscles At post-mortem examination the spinal cord

not of itself prove a serious burden for as has been pointed out earlier in this memorandum the responsibilities of the insurance practitioner in respect of these persons is to a not inconsiderable extent preventive and advisory The practitioner would have had less duties in relation to incapacity and more in relation to positive instruction on health and in the *early* detection and treatment of disease Although he will not be required to undertake the actual filling in of national health insurance certificates his responsibility in so far as certification is necessary for other purposes remains unchanged For example the employer will require certification of evidence of incapacity in most cases It would be in the interest of the insured person if no charge were made for these certificates and if the standard rate were paid the profession would agree officially or unofficially to provide these certificates without separate charge to the insured person

(xi) If the principle of differentiation of age groups is carried to its logical conclusion it will be found that the duties and responsibilities in respect of medical care are greater in this age group and those in relation to certification would be less than for adult age groups This being so there is in the view of the Insurance Acts Committee no case for differentiation between the capitation fee from that of other classes of person In any case the proposal of a modified capitation fee is inconsistent with the general principle underlying the present national health insurance system

Finally the Committee decided that unless an offer of the standard capitation rate less a deduction of not more than 5 per cent in respect of certification were made a Special Conference of representatives of Local Medical and Panel Committees should be immediately called and recommended not to accept the Ministry's proposals

The Ministry's Reply

On Christmas Eve the reply of the Ministry of Health was received

In regard to the Insurance Acts Committee's submission on the general question of the amount of medical care involved it is stated that while the Minister

> 'remains satisfied that persons within the age group in question are likely having regard to their comparatively low sickness experience to make fewer demands on the services of practitioners than persons of older ages he does not wish to press this point unduly since he recognizes that in the interests of public health it is desirable that juvenile workers should remain as far as possible under medical supervision

On the question of certification it was stated that it seemed clear to the Minister

> that account must be taken not only of the medical and clerical work involved in the actual issue of certificates but also of the fact that patients who are not entitled to weekly payments of sickness benefit will not present themselves to their doctors with such frequency as those who are so entitled and therefore require the certificates in support of their claims The Minister cannot accept the contention that in view of requests for certificates required by the patient's employers practitioners would not in effect be relieved of this work to any considerable extent
>
> In all the circumstances the Minister is prepared to provide for a capitation fee of seven shillings and sixpence on the understanding that if the standard capitation fee for adults should be increased or reduced in future the rate for juveniles should be varied proportionately

In conclusion it is stated that the Minister has consulted the Secretary of State for Scotland and the Ministry of Labour for Northern Ireland and that they wish to be associated with him in the terms of his letter

The Special Conference

In accordance with the decision of the Insurance Acts Committee this Conference has been called for Thursday January 7th 1937 at 2 p m It will be observed that while the original contention of the Ministry that less work will be involved in the care of these young adolescents is not pressed certification has been valued for the purposes of deduction at 1s 6d and a capitation fee of 7s 6d is offered

In accordance with its resolution the Insurance Acts Committee will recommend the Conference to reject the offer A meeting of the Insurance Acts Committee will be held on the morning of the day on which the Conference meets when it will consider the questions of procedure to be recommended to the Conference in the afternoon

NOTES OF THE WEEK

British Guiana

A committee appointed by the Governor of British Guiana to inquire into the administration and organization of the medical services of the Colony has recently submitted its report The report contains a number of recommendations relating to the salaries scales and the personnel of the different branches of the medical service including some with which the British Guiana Branch of the Association has expressed strong disagreement The Dominions Committee will consider at its next meeting the report of the committee and the memorandum prepared by the Branch

Gifts for Medical Research

Medical practitioners are often asked by patients and other persons to advise them in the matter of bequests or gifts for medical research The Medical Research Council has issued a leaflet explaining the facilities possessed by the Council for the reception and administration of private benefactions entrusted to it for the promotion of medical research and offering advice on the method of making gifts to this purpose The Council already administers a number of bequests and funds derived from private sources and the leaflet points out that private benefactions are used to supplement and not to relieve grants from public funds

Fees in Kent

The Kent Education Committee considered at its last meeting two questions concerning fees for medical services The first related to the fees payable for radiological examinations to the Royal Victoria Hospital Dover which has recently adopted the British Medical Association scale of charges The committee is to ask the hospital to agree to a flat rate of £1 11s 6d for all x-ray examinations in orthopaedic cases instead of the scale in which the charge varies according to the type of examination involved It was decided to amend the scale of charges made to parents for tonsil and adenoid operations on school children so that the fee charged to a family whose income lay between 7s 6d and 10s per head per week should be reduced from 10s 6d to 7s 6d

---

At a meeting of practitioners recently convened by the Belfast Division a committee was appointed to consider the question of a Public Medical Service for the area

Dr W Ainslie has retired from the appointment of honorary surgeon to the Herefordshire General Hospital a post which he has held for twenty four years

Dr S A E Griffiths has retired after thirty five years practice in Meopham

COUNCIL HOSPITALS AND THEIR MEDICAL STAFFS

The Local Government Act of 1929 has been the means of introducing a new type of hospital and of placing the provision of hospital services on a new basis Before the passing of this Act two parallel uncoordinated hospital services were being administered by two different types of statutory authority Local government authorities, under the powers conferred on them by various Acts of Parliament, provided institutional accommodation in connexion with their public health functions Although under the Public Health Act of 1875 they were empowered to provide general hospital accommodation, for the most part they confined their hospital provision to the treatment of infectious disease, tuberculosis, mental disease, normal and abnormal maternity, venereal disease, and diseases of children These facilities were available for the whole of the local population Boards of guardians as local Poor Law authorities, also provided institutional accommodation but they were interested in only a limited section of the population—namely, the destitute Their provision, on the other hand, included all types of hospital accommodation for all kinds of illness, both acute and chronic and for children, adults, the aged, and the infirm The test for admission was destitution, and not, as in the case of the local authorities' institutions, medical need

Appropriation of Poor Law Hospitals

One of the objects of the Local Government Act was to substitute for this dual hospital service a unified service administered by the local government authority and available for all the inhabitants of the area The boards of guardians were abolished, and their functions, including that of hospital provision, were absorbed by the local government authorities The Act enabled the latter to appropriate institutions or hospital beds formerly reserved for the sick poor and to provide therein for the general population of the district services under the authority of the Public Health and allied Acts The stigma of the Poor Law has thus been removed from the nation's hospital services, and the destitute person is offered the same service as those in more fortunate circumstances, the sole test for admission to a local authority's institution being now not financial means, or lack of means, but medical need Moreover, as the lower income limit has been abolished, so there is no higher income limit, any local resident has the right to enter any of the local authority's institutions which can offer the advice or treatment that his condition requires, and the local authority must charge him for those services according to his capacity to pay for them

Substantial progress has already been made with the appropriation of institutions, more especially in London and Middlesex and the county boroughs Progress has been slower in the county areas, where the population is more scattered and the organization of a unified hospital service more difficult The London County Council assumed responsibility on April 1st 1930, for seventy-six general and special hospitals and institutions containing more than 42,000 beds It has undertaken an extensive scheme of reorganization of services and equipment, it has introduced a complete consultant and specialist service for its unified hospital system, and it has arranged a scheme of affiliation of general hospitals with certain medical schools for the purpose of the training of undergraduates The Middlesex County Council appropriated, on April 1st, 1936, five county hospitals and one convalescent home and it also is engaged in extensive reorganization Of the eighty-three county boroughs, thirty-four have appropriated one or more institutions and seven county councils have begun the task of appropriation and reorganization Some figures extracted from recent reports issued by the Ministry of Health will illustrate the extent of the local authorities' hospital service It was estimated in 1934 that local authorities controlled 860 hospitals of all types, containing 143 000 beds, and that there were 1,000 voluntary hospitals with a total of 72,000 beds In 1935 local authorities were administering ninety-three general hospitals with 50,508 beds under the Local Government Act or the Public Health Acts, and 448 hospitals or institutions with 71,856 beds as Poor Law accommodation

The transference of institutions to the local government authority means something more than the mere substitution of one administrative body for another The appropriation of hospitals enables the local authority to conduct a single efficient co ordinated hospital service for its area, to concentrate special services in special units, and to co-operate with the voluntary hospitals The appropriated institution itself benefits by being utilized for public health purposes, for the range and standard of medical treatment and the facilities for diagnosis and treatment tend after the appropriation to be improved and the equipment to be modernized Such improvements and the wider scope of professional experience consequently available attract medical and nursing staffs of a better type, and practitioners may now find in the new council hospital service a career worthy of their best endeavours The facilities for post-graduate study will no longer be confined to the voluntary hospitals, and council hospitals will be able in the future to play an important part in the progress of medical research and treatment In short, the Local Government Act constitutes a revolution in the history of hospital development in this country

Co-operation With Voluntary Hospitals

One of the great advantages of the new administration is the opportunity for useful co-operation between the council and voluntary hospitals, and, by this means, of promoting still further economy and efficiency in the nation's hospital service as a whole Section 13 of the Local Government Act imposes upon county and county borough councils the obligation of consulting, upon questions relating to the provision of hospital accommodation, with committees representative of the governing bodies and medical staffs of the voluntary hospitals in the area concerned Such consultation is in the interests of both the voluntary and the council hospitals In spite of the magnificent work and the enormous resources of the voluntary hospitals, they are unable to provide accommodation and treatment for all acute cases, and their efforts must be supplemented by those of the local authorities Friendly consultation between the two services will prevent inefficiency and wasteful competition The voluntary hospitals themselves will derive mutual advantage from the appointment of a joint representative body, for, through it, they will be able to co-operate in such matters as the interchange of staff, the selection of cases, and equipment and beds

The effective development of the opportunity offered by the Local Government Act presupposes co-operation between the responsible authorities and the organized medical profession The successful organization of a local hospital service depends to a very large extent upon the attitude of the profession, and such questions as medical staffing, the admission of patients, the provision of special services and the treatment of private patients

was normal In the peripheral nerves the lesions were wholly interstitial the axis cylinders remaining intact There was lymphocytic infiltration of the nerves, especially round the blood vessels many small haemorrhages and a great increase in number of the nuclei of the sheath of Schwann Guillain believes that the course of the disease can be favourably influenced by treatment He recommends intravenous injections of sodium salicylate from 1 to 2 grammes daily in serum containing 10 per cent. of glucose intravenous or intramuscular injections of quinine or colloidal silver and inunction with colloidal silver Arsenical preparations have been found definitely harmful

PEKING MAN

At the close of 1927 news came from China of the discovery of three more skulls of Peking Man (Sinanthropus) In this way Professor Weidenreich who took charge of the Cenozoic Laboratory in Peking after the death of Professor Davidson Black came to have six skulls of this extinct race of humanity at his disposal for study—besides fragments—mostly of jaws and skulls—of other twenty individuals In a recent communication to the *Times* (February 18) Professor Weidenreich sums up the chief conclusions he has reached concerning the place which must be given to Sinanthropus in the gallery of extinct humanity Hitherto the pride of lowest place has been assigned to the Java Man (Pithecanthropus) Professor Weidenreich shows cause why China must now oust Java as the home of the lowest known form of humanity He finds that in brain size a member of the Sinanthropic family had even a smaller brain than Pithecanthropus Still this claim will be seen to be not a strong one when it is remembered that among the Australian aborigines of to day individuals do occur with a brain as small as that of the smallest Sinanthropus—850 c cm Professor Weidenreich's claim of a low position for Peking Man in the scale of humanity does not rest only on small brainedness He cites characters which ally this ancient form of humanity—at least half a million years old having lived at a very early phase of the Pleistocene Period—with anthropoid apes on the one hand and Neanderthal Man of Europe on the other Sinanthropus being a sort of stepping-stone from the one to the other Very remarkable too is the fact that the Peking men and women differed from each other in size and strength almost as much as a male gorilla differs from the female gorilla Noteworthy too is the range of variation in jaw tooth and brain size which prevailed in the humanity of Pleistocene China In his article in the *Times* Professor Weidenreich puts forward the idea that Mongolian features can be recognized in the anatomical make up of Sinanthropus and that Peking Man may prove to be the modern Chinaman in the rough This revolutionary conception will not surprise those who are familiar with the address given by Sir Arthur Keith to the newly founded Speleological Association in the summer of last year In that address it was maintained that the evidence provided by fossil remains indicates that the chief races of modern man—white, brown yellow and black—were already separated early in the Pleistocene and that since their separation all have undergone parallel changes which have given them their "modern" characteristics—reduction in jaw and tooth with planing down of their rugosities of skull and limb bones

"SIMPLE PNEUMONITIS"

Pneumonia in childhood is notoriously different from that disease as it affects adults, and Dr A Morton Gill[1] has recently described a series of cases in which he believes there is a low grade inflammatory process affecting chiefly the pulmonary alveoli which can be diagnosed from pneumonia and recognized as a separate entity for this he suggests the term "simple pneumonitis" The child is brought to hospital for a persistent cough of recent origin loss of weight and loss of appetite There may have been expectoration of blood stained sputum and the mother may be suspicious of tuberculosis The child is listless with normal or only slightly raised temperature normal respiration rate, and a slightly increased pulse rate Physical examination of the chest will show one or more areas with slight impairment of percussion note normal or slightly weakened breath sounds and rales which are particularly persistent and "sticky" in character The x ray film reveals mottling in areas of the lung corresponding to those in which abnormal physical signs were found. There is nothing in the history to suggest that this is but the end of a pneumonia and within a week or two the symptoms signs and x ray changes have disappeared *Dr Gill cites* four examples of this observed in the children s department at the Middlesex Hospital He eliminates the possibility of any of the ordinary types of pneumonia or their sequels and discards the idea that the "pneumonitis" is a non resolution of a pneumonia dated from some past illness because of the comparative rapidity with which the child becomes completely well The importance of recognizing this condition lies in the facts that its prognosis is not so serious as the acute pneumonic infections and that it does not appear to follow the chronic course of those inflammatory conditions of the lung accompanying for example measles or whooping cough

QUARTERS ON SHIPBOARD AT BELFAST

In our *Supplement* this week will be found particulars of the arrangements made for the visit to Belfast of a liner the s s *Alnanzora* providing accommodation for 450 people for the Annual Meeting of the British Medical Association in July next In order to ensure that these arrangements are carried into effect bookings must be made in the immediate future

We regret to announce the sudden death on February 23 of Sir Henry Jackson Bt M B chairman of the London and Home Counties Traffic Advisory Committee and M P for Central Wandsworth

Proposed Bihar Branch

Notice is hereby given by the Council of the Association to all concerned of a proposal made by members of the Association resident in the Bihar and Orissa Province of India that a Bihar Branch be formed of area coterminous with that Province

Any member affected by the proposal and objecting thereto is requested to write to the Medical Secretary by May 27, 1937, stating the objection and the ground therefor

CHARLES HILL
Deputy Medical Secretary

February 27 1937

Branch and Division Meetings to be Held

BORDER COUNTIES BRANCH CUMBERLAND DIVISION—At Workington Infirmary Thursday March 11 3 30 p m Report of Executive Committee on its negotiations with the Public Assistance Committee of the Cumberland County Council followed by clinical meeting

BORDER COUNTIES BRANCH DUMFRIES AND GALLOWAY DIVISION—At Commercial Hotel Glenluce Wigtownshire Wednesday March 3 4 p m Meeting to discuss the reorganization of the activities of the Division in Wigtownshire Address by Dr R W Craig (Scottish Medical Secretary) Non members are especially invited to attend

DUNDEE BRANCH—At University College Medical School Dundee Tuesday March 2 8 30 p m Major T P Buist R A M C Anti gas Methods

GLASGOW AND WEST OF SCOTLAND BRANCH DUMBARTONSHIRE DIVISION—At North British Station Hotel Wednesday March 3 4 p m Mr John Hewitt Maternal Mortality in Childbirth A discussion will follow

GLASGOW AND WEST OF SCOTLAND BRANCH LANARKSHIRE DIVISION—At St Enoch Station Hotel Glasgow Wednesday March 3 3 30 p m Annual general meeting and election of officers

HERTFORDSHIRE BRANCH EAST HERTFORDSHIRE DIVISION—At Cromwell Hotel Stevenage Thursday March 4 8 p m Lord Horder Acute Streptococcal Infections and their Treatment

LANCASHIRE AND CHESHIRE BRANCH BLACKBURN DIVISION—At Old Bull Hotel Blackburn Tuesday March 2 8 45 p m Dr J Ralston Paterson (Manchester) Radium and X Rays in the Treatment of Malignant Disease

LANCASHIRE AND CHESHIRE BRANCH WIGAN DIVISION—At Town Hall King Street Wigan Friday March 5 8 30 p m First of a series of eight lectures on air raid precautions by Dr L T Chillenor medical instructor for the Liverpool Centre under the Air Raids Precautions Department of the Home Office

METROPOLITAN COUNTIES BRANCH CITY DIVISION—At Metropolitan Hospital Kingsland Road E Tuesday March 2 9 0 p m Dr E G B Calvert Modern Views on Nephritis and their Application in General Practice

METROPOLITAN COUNTIES BRANCH NORTH MIDDLESEX DIVISION Wednesday March 3 First of a course of six lectures and practical demonstrations on Air Raid Precautions and Anti gas Measures

METROPOLITAN COUNTIES BRANCH WOOLWICH DIVISION—At Woolwich War Memorial Hospital Friday March 5 8 45 p m Clinical evening

NORTH OF ENGLAND BRANCH MORPETH DIVISION—At Grand Hotel Ashington Friday March 5 8 p m Mr H Evers (Newcastle upon Tyne) Midwifery Meanderings Members of the Blyth Division are invited to attend

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION—At Alnwick Wednesday March 17 Mr T A Hindmarsh Surgical film

SHROPSHIRE AND MID WALES BRANCH—At Royal Salop Infirmary Shrewsbury Tuesday March 2 3 30 p m B M A Lecture by Dr Arnold W Stott Some Aspects of Cardiac Disease of Practical Importance from a Clinician's Point of View

STAFFORDSHIRE BRANCH NORTH STAFFORDSHIRE DIVISION—At North Staffordshire Royal Infirmary Stoke on Trent Thursday March 4 4 30 p m Mr A Lawrence Abel Common Diseases of the Rectum and Anal Canal 7 30 p m Dinner at Grand Hotel Hanley

SURREY BRANCH KINGSTON ON THAMES DIVISION—At Kingston and District Hospital Friday February 26 8 30 p m Clinical demonstration Film illustrating Professor Bohler's technique for ambulatory treatment of fractures having special regard to fractures of the humerus and demonstration of application of plaster of Paris

SUSSEX BRANCH WEST SUSSEX DIVISION—At Dolphin Hotel Chichester Wednesday March 3 7 30 p m Annual meeting of the West Sussex Clinical Society followed by dinner at 8 p m

Meetings of Branches and Divisions

ASSAM BRANCH

The annual general meeting of the Assam Branch was held at Jorhat from February 2 to 4 The attendance included Dr G C Anderson (Medical Secretary) Dr L E Napier representing the Calcutta School of Tropical Medicine and Major H Lockwood Stevens organizing secretary of the London School of Hygiene and Tropical Medicine

The following officers were elected

President Dr F C McCombie *Honorary Secretary and Treasurer* Dr B A Lamprell *Representative in Representative Body* Dr C G Terrell *Deputy Representative in Representative Body* Dr G C Ramsay Assam Valley Division *Chairman* Dr McCombie *Honorary Secretary* Dr Lamprell Surma Valley Division *Chairman* Major J L Donnel I M S *Honorary Secretary* Dr J O Gordon Northern Bengal Division *Chairman* Dr J H Arthur *Honorary Secretary* Dr C C Harrison

Dr Ramsay was elected delegate for the Surma Valley Division at the annual meeting of the British Medical Association at Belfast in July and Dr M E T Burke delegate for the Assam Valley Division Dr Ramsay was also appointed the representative of the Branch at the joint meeting with the Bombay Branch to be held at Bombay before the departure of Dr Anderson

DORSET AND WEST HANTS BRANCH BOURNEMOUTH DIVISION

A meeting of the Bournemouth Division was held at Boscombe Hospital on January 27 when Dr F W Broderick was in the chair A resolution was unanimously passed approving the principle of free choice of doctor by public assistance patients

Dr Doris Odlum read a paper on Psychotherapy Its Uses and Failures Dr Odlum opened by saying that there were four different methods of employing psychotherapy The first was by suggestion This played an important part in all medicine and depended entirely on the personality of the doctor but was not considered by most psychologists as very successful The second method was by hypnosis The mental state of a patient under hypnosis was not fully understood hypnosis had to be used with great caution or more harm

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

THE CHEMISTRY AND ASSAY OF MALE HORMONES

BY

R K CALLOW, M A, D.Phil

AND

A. S PARKES, Sc D, F R S

The more obvious effects of castration, some of which have been known since early times, comprise atrophy or non development—according to whether the operation is pre-pubertal or post-pubertal—of the accessory organs and secondary sexual characters The former include the prostate, seminal vesicles, Cowper's gland, and penis, the latter, the comb of the fowl, the horns of the stag, and the body configuration, the deep voice, and the special distribution of hair in many species, including man Grafting experiments showed that the control of the testes over the accessory organs and secondary sexual characters was probably endocrine in nature In 1927 McGee prepared extracts of testis capable of restoring the atrophic comb of the capon, and an endocrine function of the testis was definitely established Since then androgenic* substances have been found elsewhere in the body, but the effects of castration indicate that the testis is the essential and primary source Various procedures such as x-irradiation, or ligation of the efferent ducts, which cause atrophy of the testis tubules, suggest the interstitial tissue as the site of origin of the testis hormone

Detection and Assay of Androgenic Activity

Reversal of any of the changes which follow castration or the production of a state of hyperorchidism might be used to detect male hormone activity The Chicago workers, Moore, Koch, and Gallagher, used first the capon comb as a test object, but they subsequently described a number of tests on castrated rats and guinea-pigs, based on the cytological condition of the epithelium of the seminal vesicles, prostate, and Cowper's glands, the survival of motility of epididymal spermatozoa, and the power to ejaculate [See Koch (1932) and Moore (1935) for reviews of this work] Voss and Loewe (1930) attempted to assess gross size changes in the seminal vesicles of castrated mice but finally used epithelial changes Martins and Rocha (1930) measured the size of the seminal vesicles of the castrated mouse before and after treatment Korenchevsky and his co workers (1932–3) developed a method based on the weight of the seminal vesicles and prostate of castrated rats In addition, such tests have been described as the increase of spontaneous activity of castrated mice the growth of the crest of the male salamander, the production of the nuptial coloration of the male bitterling growth of the ovipositor of the female bitterling and blackening of the beak of the anoestrous or capon sparrow

The only generally employed quantitative tests, however are those based on production of growth in the comb of the caponized domestic cock or in the accessory glands of the castrated rat Of these the former is the easier and less equivocal test The Second Conference on the Standardization of Sex Hormones (*Quart Bull Hlth Org L o N*, 1935, **4**, 618) recommended that "on the information before the conference the test based on the induction of growth in the comb of the capon is, at present, the only one sufficiently specific for the quantitative determination of activity in comparison with the standard preparation" The conference also agreed that the international standard preparation for male hormone activity should consist of crystalline androsterone and that "the unit of activity shall be defined as the activity of 0 1 mg of this standard as tested by a specific biological reaction, this weight is approximately the daily dose required to give an easily measurable response in the comb after five days" An increase in comb size of about 5 mm in length plus height or 15 per cent increase in area may be expected from one international unit (I U) daily for five days Detailed techniques have been described by Dodds *et al* (1930), Schoeller and Gehrke (1931), Freud *et al* (1932), and Greenwood *et al* (1935) as well as by the Chicago workers referred to above

However, it is clearly desirable that quantitative work should be carried out on mammals Increase in weight of the prostate and seminal vesicles of castrated rats is the simplest mammalian criterion of androgenic activity, and has been used extensively by Korenchevsky (1932 *et seq*) Freud (1933 *et seq*), Callow and Deanesly (1935), and Tschopp (1936) With the amounts of androgenic substance now available a readily assessable degree of enlargement can easily be obtained The total weight of the seminal vesicles and prostate of the castrated rat is between 20 mg and 50 mg according to the technique of dissection, and increase to an average of 660 mg has been produced by only ten days' treatment with male hormone (Parkes, 1936) The chief difficulty lies in the fact that the several accessory glands respond in different degrees to the different androgenic substances so that the comparative activities of the different substances depend largely upon which organ is employed as a basis for comparison Androsterone, for instance, is comparatively ineffective on the seminal vesicles, and produces quite an abnormal ratio of growth between these and the prostate A second difficulty is that the effectiveness of a preparation is greatly influenced by the conditions of absorption (Deanesly and Parkes, 1936a)

Natural and Artificial Sources

The demonstrable male-hormone activity of testis tissue is comparatively small, as might be expected from the small proportion of interstitial tissue present Thus extract equivalent to 0 5 kg of tissue may be necessary to induce good comb growth in a five day test Favourable clinical results have been reported from time to time with dried tissue or testis extracts of low concentration but in the absence of objective laboratory tests it is likely that these results are due to psychological rather than to direct physiological action Testis extracts of sufficient potency, as measured by animal tests, for clinical use could only be prepared at enormous cost The isolation of crystalline testosterone from bull's testes by David in 1935 was of great importance, but the process is not commercially economical

* The terms androgenic in the sense of causing the development of male organs and characters and androgen a substance with this property have been used by American writers They supply very necessary parallels to the terms oestrogenic and oestrogen applied to female sex hormones

than good could be done In the majority of cases it was a failure as it did not rouse the active help of the patient In some cases it did relieve the patient of symptoms of which he or she complained, but it did not get rid of the cause and therefore other symptoms which might be worse occasionally appeared subsequently The third method was by persuasion The patient had to be persuaded to talk over his troubles and his past life, in some cases this was a very successful form of treatment The fourth method was by mental analysis, which was originated by Freud and modified by Adler The great objection to mental analysis was that it took a great deal of time, sometimes extending over four or five years, thus limiting its uses Mental disorders might be grouped into (1) mental deficiency (2) insanity and (3) psychoneuroses In cases of mental deficiency psychotherapy was useless This was also true in cases of insanity, except perhaps where a patient was recovering, when some benefit might result It was in the psychoneuroses that it was employed

An interesting discussion followed which was opened by Dr L A WEATHERLY Drs S WATSON SMITH WALTER ASTEN SIMMONS HORWICK BRODERICK, C F PEDLEY JENKINS C E GAUTIER SMITH, and N F ADENEY also took part in the discussion A hearty vote of thanks was then proposed by the CHAIRMAN to Dr Odlum for a very instructive and interesting paper and this was carried with acclamation

DUNDEE BRANCH

A meeting of the Dundee Branch was held at University College Dundee on February 2, when MISS AGATHA H BOWLEY clinical psychologist to the Dundee Child Guidance Clinic gave an address on The Psychological Aspects of Child Development in the course of which she outlined the history of the child guidance movement In conclusion Miss Bowley emphasized the importance of such positive factors in child upbringing as security in home conditions serenity in family relationships and the value of constructive outlets and companionship to the child

EAST YORKSHIRE BRANCH

At a meeting of the East Yorkshire Branch, held at Hull on February 10 with Dr S F FOURACRE in the chair, Professor JOHN HAY (Liverpool) delivered an address on The Life History of Mitral Stenosis

Professor Hay stated that this disease occurred chiefly among females Acute rheumatism was the essential aetiological factor, chorea being included in this heading Mitral stenosis was almost entirely rheumatic in origin and was really a pancarditis The types encountered were (1) buttonholed (2) funnel shaped and (3) a type encountered in older people who also had an aortitis in which there was sclerosis of the auriculo ventricular ring and so some degree of mitral stenosis developed It took a number of years for stenosis to develop Aortic regurgitation developed in a few weeks Dr Rosier's form occurring mostly in females was accompanied by a small left ventricle a large left auricle and a late development of regurgitation The first stage in mitral stenosis (up to the age of 15) was usually a grumbling infection with perhaps a slight rise in temperature The second stage between 15 and 30 years showed doubtful activity of infection while in the third stage (over 30) there was no grumbling infection

With regard to clinical manifestations usually a pancarditis occurred and there might be polyarthritis Chorea was liable to appear and rheumatic nodules to develop Young children might exhibit a syndrome—wasting with anaemia and a slight pyrexia This might be early rheumatism If there was a systolic bruit and also a mid diastolic bruit or third sound it was definitely a rheumatic heart There were no symptoms pathognomonic of mitral stenosis A child might be without symptoms The earliest of physical signs were the systolic bruit alteration in mitral first sound which was louder—a crescendo bruit which was presystolic and might be accompanied by a slight high pitched systolic bruit If substernal heaving was present it was indicative of advanced mitral stenosis with an enlarged right ventricle Mild exercise accentuated the presystolic sound The diastolic sound of an aortic leak might be mistaken for a mitral systolic Increase pulse pressure meant aortic lack Mitral stenosis might be missed when auricular fibrillation was present—the bruits might disappear with the onset of fibrillation there might be a short systolic and a low rumbling diastolic sound or there might be a diastolic sound running into an extra first sound

The mode of development of mitral stenosis depended on the original infection home conditions and recurrent exacerbations In females puberty pregnancy and the menopause seriously reacted on grumbling infections or stenosis On leaving school a girl's first job might precipitate cardiac failure The disease might spread along two lines in the first the patient dies at the age of 40, having had a normal cardiac rhythm and a period of cardiac failure of probably ten years, in the second a patient might fibrillate and die at 35 having had cardiac failure for fifteen years The outlook was generally better for those with fibrillation as the latter could be dealt with and the life and heart controlled Once mitral stenosis had settled down it might go on for years Pregnancy was not contraindicated so long as there was no fibrillation, death occurred in 2 to 3 per cent of cases The cardiac reserve depended on the myocardium The first attack of fibrillation was usually recovered from in twenty four hours with adequate treatment Dyspnoea was an outstanding symptom of mitral stenosis The ease with which it came on was a gauge of the severity of the disease as there was no interference with the normal supply of oxygen

Cyanosis meant a defective ventricular drive The left ventricle had not enough blood The alveolar walls were engorged there might be haemorrhage and emphysema might develop due to the diminished elasticity of the alveolar walls There was an oxygen starvation of the tissues In children a form of dwarfism might occur due to oxygen lack Paroxysmal fibrillation or flutter might be preceded by extra systoles arising in the auricles Sometimes a mania developed with the disease Cerebral embolism might develop on the cessation of the fibrillation

The pain with mitral stenosis was not the typical anginal substernal pain In subacute infective endocarditis there was a rise in temperature bruits recurrent sweats and general weakness Blood cultures might help but many were sterile There were embolic manifestations—petechiae under the nails tender pads changes in the retinae rheumatic nodes

Up to the age of 15 years the infection was alive therefore exercise should be restrained The patients needed a dry sunny climate or artificial sunlight If the tonsillar glands were tender the tonsils should be removed Any infected teeth should be extracted Underfeeding and damp should be avoided Massive oedema in a child with a bad heart was very rare Influenza tonsillitis pneumonia, and any other septic conditions were dangerous to a rheumatic heart as the myocardium was affected thereby Cases of this kind required more rest

The CHAIRMAN and Drs L LAVINE G GRIFFITH and L I HARDY took part in the discussion which followed A vote of thanks was proposed to Dr IRVINE and seconded by Dr GRIFFITH

ESSEX BRANCH MID ESSEX DIVISION

At the annual general meeting of the Mid-Essex Division held at Chelmsford Hospital on January 21 the following officers were elected

Chairman Dr W S Willmore *Vice chairman* Dr S G Corner *Secretary and Treasurer*, Dr J T Whitley

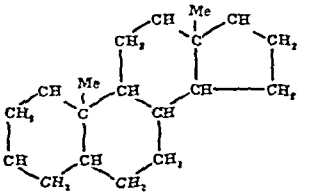
Dr F E CAMPS and Dr J L MILLER WOOD opened a discussion on a proposed scheme for puerperal investigation in Mid-Essex Dr Miller Wood summarizing his remarks said that the local scheme should include (*a*) better understanding on the part of doctors and nurses of the sources and modes of spread of puerperal infection (*b*) better education of patients on similar lines (*c*) encouragement of freer co operation between general practitioners and the county medical officer with a view to earlier reporting in contradistinction to notification of all doubtful or suspicious rises of temperature in the puerperium (*d*) fuller use of the services of an up to date centrally placed laboratory

GLASGOW AND WEST OF SCOTLAND BRANCH

At a meeting of the Glasgow and West of Scotland Branch held on January 20 when Dr J G MCCUTCHEON was in the chair Mr A G TIMBRELL FISHER delivered a British Medical Association Lecture on Manipulative Surgery The attendance of almost 200 included members of the Chartered Society of Massage and Medical Gymnastics the Corporation of Certified Masseurs and the College of Nursing Mr Timbrell Fisher emphasized the need in medical education in this country for facilities for the teaching of manipulative surgery Those who castigated the profession in the matter of manipulative surgery overlooked the work of notable pioneers If the profession endeavoured to place manipulative surgery upon a firm scientific basis there would be no need for unqualified bone setters and they would regain the public confidence that they had to a certain extent lost The medical historian of the future when he came to view this period would doubtless be surprised at the lack of vision by those responsible for medical education in this country

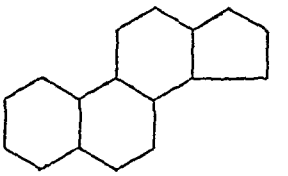
Loewe and Voss (1929) first reported that extracts capable of reversing castration changes could be prepared from the urine of normal men This discovery led to the preparation of large quantities of androgenic concentrates for physiological and clinical investigation, but it is now known that the substances in the urine androsterone and dehydroandrosterone, are different from the active substance, testosterone isolated from the testis Crystalline androsterone was first isolated in very small yield from urine by Butenandt in 1931, but it was later found that male hormone equivalent to about 3 mg androsterone per litre is present From androsterone the reduction product, androstanediol has also been made in crude or in pure form In 1934 Ruzicka and his collaborators prepared androsterone from cholesterol by way of *epi*cholestanol On the theoretical side this brilliant piece of work confirmed and amplified the details of the constitution for androsterone suggested by Butenandt (1933) practically, it has led to the artificial production on a manufacturing scale of both androsterone and testosterone, and to the ready accessibility of many related compounds for investigation of their physiological activity The so called 'synthetic' pure male hormones are now far more readily available than the same substances from natural sources

Although the compounds mentioned above account for most of the androgenic activity of the testis and of urine, it cannot be assumed that other active substances are not present For instance, the isolation of a crystalline compound from boar's testes, tentatively identified with androstanedione, has been reported The nature of the androgen detected in bull's blood amounting to 1 to 2 units per litre is not yet known Finally, the substances are as yet unidentified to which the urine of normal women owes its androgenic activity (Womack and Koch, 1932, Koch, 1936) which is about the same as that of male urine and the significance, if any of the presence of male hormone in the female is unknown The phenomena of virilism are outside the scope of this article although its association with adrenal hyperplasia, and with the excretion of large amounts of androgenic material in the urine coupled with the isolation from adrenals of a series of steroids which includes a weak androgen adrenosterone (Reichstein 1936) indicate that glands other than the gonads must be considered in the story of androgen metabolism



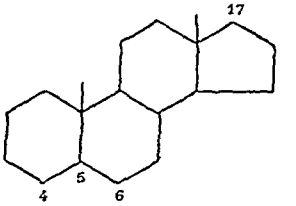
Constitution and Nomenclature

Work now published and in progress on a multiplicity of compounds with androgenic activity makes it necessary to give some attention to the systematic nomenclature

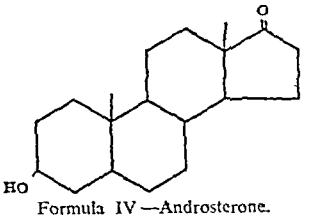


The natural or artificial androgens so far known are all simple derivatives of the tetracyclic hydrocarbon androstane (Formula I) This is the dimethyl derivative of fully hydrogenated *cyclo*pentenophenanthrene the skeleton of which (Formula II) is regarded as the schematic parent of all the steroids—that is the sterols bile acids, male and female hormones cardiotonic aglucones saponins and toad poisons

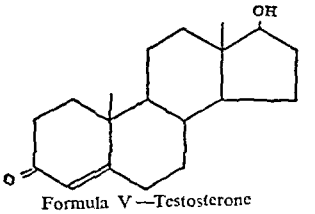
The systematic nomenclature of the male hormones is based on the root androst with the addition of appropriate suffixes and of numbers in the usual way to indicate the nature and position of substituent groups The numeration is somewhat illogical for historical reasons, and it is fortunate that only five positions need be considered—namely 3, 4 5 6 and 17 (Formula III)



The known derivatives of interest are either dihydroxy derivatives (diols) diketo-derivatives (diones) or mixed hydroxy ketones (olones) with the groups in positions 3 and 17 and these may either be saturated (ane-) or have an unsaturated linkage at 4 5 or 5 6 (Δ^4 or Δ^5 ene) A series of 17 alkyl derivatives (for example 17 methyl- -17-ol) has also been prepared In certain cases which need not be dealt with here it is necessary to consider the configuration (*cis* or *trans*-) of the groups round carbon atoms 3 5 and 17 Nearly all the possible permutations and combinations of these substituent groups and double linkages are represented among the artificially prepared compounds which provide a happy hunting ground for the investigator of relations between chemical constitutions and physiological activity



Formula I—Androstane



Formula II—*cyclo*Pentenophenanthrene

Formula III—Numeration of androstane derivatives

Formula IV—Androsterone.

Formula V—Testosterone

The two compounds of greatest importance possess common names androsterone which is androstan 3 ol-17-one (Formula IV) and testosterone which is Δ^4 androsten 17-ol 3-one (Formula V) and some names (of unfortunate ambiguity) have been derived from these—for example dehydroandrosterone (Δ^5 androsten 3 ol 17 one) and dihydrotestosterone (androstan 17 ol 3 one) and are used in preference to the less euphonious systematic names

Physical and Chemical Properties

The male hormone compounds are colourless crystalline substances readily soluble in most organic solvents moderately soluble in oil but very sparingly soluble in water or aqueous media. It is therefore necessary to administer them therapeutically in oil solutions Such

There should be chairs of physical medicine in every university or teaching centre so that medical students might learn something about that enormously important branch of medicine As success in manipulative work demanded a long and exacting course of training they should encourage the young men now entering medicine to specialize in it Mr Timbrell Fisher said that the theories on which osteopathy was founded were untenable and the evidence on which they were based did not bear scientific scrutiny If those theories were harmless one could safely ignore the cult but unfortunately there were many instances in which osteopaths paid little or no attention to diagnosis In this way patients with malignant disease often wasted precious time and money while their condition steadily deteriorated

At the close of his interesting address Mr Timbrell Fisher gave a demonstration of technique and also replied to a number of questions on various points At the conclusion of the meeting he was accorded a hearty vote of thanks for his address

LINCOLNSHIRE BRANCH LINCOLN DIVISION

A general meeting of the Lincoln Division was held on February 4 when Dr G C WELLS COLE was in the chair Dr H B Willoughby Smith was elected representative in the Representative Body and Dr G Douglas Summers representative on the joint committee (with the Lindsey County Council) on the domiciliary relief scheme Dr Willoughby Smith was also appointed to represent the Division in the Treasurer's Cup golf competition at the Annual Meeting at Belfast in July The meeting unanimously adopted binding resolutions under its ethical rules regarding whole time medical officers and domiciliary attendance The SECRETARY outlined the Lincoln city scheme for maternity and child welfare and after a discussion it was agreed to give the scheme a trial

METROPOLITAN COUNTIES BRANCH STRATFORD DIVISION

Public Education in Health

Under the auspices of the Stratford Division a conference on public education in health was held at Queen Mary's Hospital for the East End when Dr R A WOODHOUSE was in the chair and there were present the delegates of the Division (Drs Wilson Welply Barker and Boyde) Sir Henry Brackenbury representatives from the West Ham Borough Council the Urban District Councils of Dagenham Hornchurch and Romford the Insurance Committees for East Ham Essex and West Ham the Medical Committee of Queen Mary's Hospital for the East End and the General Committee of St Mary's Hospital for Women and Children

Sir HENRY BRACKENBURY summarized the views of the British Medical Association on the question before the conference and emphasized the need for a wider conception of health—that attention should be directed not merely to the diseased organs of the individual but to his whole physical (and especially) mental make up Education of the general public not so much in the avoidance or recognition of disease as in the maintenance and development of physical fitness was necessary Sir Henry spoke of the importance of the work of local authorities in what he termed the community health service nutrition housing smoke abatement and noise abatement being matters in which local authorities could (and did) have a progressive influence While recognizing that much was already being accomplished in this direction by local authorities Sir Henry suggested that a necessary weakness in their work as at present organized lay in the difficulty of getting the propaganda *to the individual on a mass scale* This difficulty could be largely overcome if the general medical practitioners organized through the British Medical Association could be brought into co operation with local authorities Such co operation he concluded was the policy of the British Medical Association nationally and in the Stratford Division

Dr HARRY C BOYDE secretary of the Division pointed out the marked propensity on the part of very large sections of the community (especially the youth of both sexes) in recent years to search for positive physical health and fitness This was a good thing and should be encouraged Some form of co operation of all the bodies interested—chiefly local authorities insurance committees hospital committees and the local organization of medical practitioners—was necessary to further and develop this movement The British Medical Association had no new methods of propaganda to offer but if the usual methods of lectures films exhibitions posters etc were organized by some body representative of these authorities then much better results would accrue Dr Boyde suggested that if such organized co operative propaganda were to be attempted it might be directed very effectively industry by industry or to special industrial or professional groups of persons With regard to the suggestion of a standing joint committee of all bodies concerned in the area Dr Boyde expressed the view that difficulties (especially of finance) would have to be overcome He felt however that given enthusiasm for the work and friendly consultation such difficulties were not insuperable

Twelve speakers took part in the discussion which followed There was complete agreement with the general propositions and the hope was expressed that after the delegates had reported back it might be possible to draft some concrete scheme on the lines suggested As regards finance it was pointed out that only local authorities and insurance committees might be in a position to offer financial backing and some of the delegates of the local authorities stated that the question of finance presented a difficulty It was felt however that a scheme could probably be made largely self supporting If the voluntary co operation of local practitioners could be secured that in itself would represent a very positive contribution from the British Medical Association in addition Sir Henry Brackenbury assured the conference that the head office of the Association would be prepared to make a grant to assist the Division in other respects On behalf of the insurance committees it was emphasized that their funds for this purpose if any were very limited An insurance committee delegate described some of the attempts that had been made in the past along the lines suggested with varying degrees of success He had always felt that the results of those attempts had suffered through the absence of the wholehearted co operation of the medical practitioners which it would seem was now to be made available

At the close of the debate it was resolved unanimously that a report of the conference be drafted by the chairman Mr C A Clark clerk of the West Ham Insurance Committee and the honorary secretary of the Division and circulated to all the authorities and committees concerned so that the matter might be further discussed

SUSSEX BRANCH BRIGHTON DIVISION

The annual joint meeting of the Brighton Division and the Brighton and Hove Association of Pharmacy was held at Brighton on February 11 The meeting was preceded by an informal dinner which was attended by a representative gathering of members of both bodies Mr W DEACON gave an interesting address on The Romance of Hospitals in which he traced the development of hospitals from the very earliest times to the present day The address was illustrated by coloured lantern slides Mr H J MCCURRICH on behalf of the medical members of the audience moved a hearty vote of thanks to Mr Deacon for his address and this was seconded by Mr A W PHILIPS secretary of the Brighton and Hove Association of Pharmacy

POST-GRADUATE COURSES AND LECTURES

MARCH AND APRIL

The following post graduate courses and lectures to be held in London during March and April have been notified to the British Medical Association Further particulars may be obtained direct from the hospitals concerned or in the case of arrangements made by the Fellowship of Medicine (F M) from the Secretary of the Fellowship 1 Wimpole Street W 1

Subject	Date	Place of Meeting	Nature of Instruction
Endocrine Diseases and Disturbances	March 2 9 12 23	*British Post Graduate* Medical School Ducane Road W 12	Last four lectures of course of five
Fractures	March 5 12 19		Last three lectures of course of six
Gynaecology Present day (continued)	March 4 11 18 25 April 1 8 15 22, 29		Course of thirteen lectures
Neurology (continued)	March 1-19	National Hospital Queen Sq W C 1	Course of lectures and demonstrations
Proctology	March 1 6	St Mark's Hospital for Diseases of the Rectum City Road E C 1	F M course
Tissue Culture	March 3 10 17	British Post Graduate Medical School Ducane Road W 12	Course of three lectures

evidence as is available indicates that they are relatively ineffective when given by mouth, and intramuscular injection is almost invariably employed The stability to heat, light, and oxygen, so far as is at present known, indicates that there is little danger of deterioration under ordinary conditions of storage Both testosterone and androsterone are secondary alcohols and therefore readily form esters, which have modified biological activity The ketonic group is also able to combine with suitable reagents, but the compounds have so far been used only for chemical separation or characterization and their physiological properties have not been systematically investigated

Relative Activity of Principal Androgens

The chief compounds with which the clinician is likely to be concerned are testosterone, androsterone, the main active constituent of urine extracts, and androstanediol, which is a reduction product of androsterone not known to occur naturally Tested on capons the same amount of comb growth is produced by 0 18 mg testosterone, 0 30 mg androstanediol, or 1 mg androsterone The relative activity on castrated rats cannot be stated simply, for in the first place it involves the different activities on the various accessory glands, and, secondly, conditions of administration and absorption exert a controlling influence on comparative activity Roughly, androstanediol is about twice as active on the prostate as androsterone and about four times as active on the seminal vesicles Given under conditions permitting of rapid absorption testosterone is only slightly more active than androstanediol, but where rapid absorption is prevented testosterone is much more effective

Modifying the Effectiveness of Androgens—"X-Substances"

In the course of their work on testis extracts the Amsterdam group discovered that acidic fractions of extracts from testis, or even from other organs, inactive by themselves, increased the efficiency of certain male hormones when injected at the same time Any idea of a strictly specific co hormone and of synergy at the site of action of the hormone was dispelled when Miescher, Wettstein, and Tschopp (1936a) showed that the same adjuvant effect was exerted by a number of pure fatty acids, but only when the hormone was mixed with the fatty acid at the site of injection The Amsterdam group maintains that the material from testis is of peculiarly high activity, but the balance of evidence is in favour of the view that there is a non-specific effect at the site of injection which may be simulated and replaced for clinical purposes by the choice of a suitable ester and a suitable solvent The effect of esterification of the male hormones is very marked as it is with the female hormones and it seems likely that this is a result of influences on the availability which depends in turn on absorption and ease of hydrolysis in the body Androsterone is excreted in normal urine in a combined form, probably an ester with glycuronic acid, which is readily soluble in water and is inactive, perhaps because of rapid elimination Water-soluble derivatives, the alkali salts of the hydrogen succinates of androsterone and androstanediol have also been prepared in the laboratory, and according to Korenchevsky *et al* (1935), their activities are only one ninth and one-third respectively of those of the free hormones The important esters from the therapeutic point of view are those with simple fatty acids Ruzicka and Wettstein (1936) have prepared the complete series of testosterone esters from formate to valerate and certain others and Miescher, Wettstein, and Tschopp (1936b) have tested these biologically, reaching the conclusion that optimal activity is possessed by the propionate This ester, unlike free testosterone, retains effectiveness even with 10-day intervals between injections (Parkes, 1936)

Anomalous Activities of Male Hormone Compounds

The fact that extracts of testis and male urine might show oestrogenic properties has been known for a number of years but this was usually held to indicate the presence of oestrogenic substances, probably of the oestrone group in addition to male hormone It is now known however, that certain members of the androstane series are oestrogenic Androsterone was originally reported not to show oestrogenic properties, but it now appears that heavy doses may do so (Wolff and Ginglinger 1936) Butenandt and Kudszüs (1935), however, showed that dehydroandrosterone, androstenedione and testosterone caused opening of the vagina in the immature rat and Butenandt (1936) later drew attention to the oestrogenic activity of *trans* androstenediol, which will cause cornification of vaginal epithelium (Deanesly and Parkes, 1936b) These compounds will feminize the plumage of capon fowl Androstanediol and testosterone cause enlargement of the uterus of the ovariectomized rat (Korenchevsky and Dennison 1936) The dual activity of these compounds is important in view of the increasing evidence that prostatic enlargement in man is due to oestrogenic stimulation

The 17-methyl and 17-ethyl derivatives of testosterone and certain of the other compounds possess the progesterone-like power to evoke progestational proliferation in the rabbit uterus (Klein and Parkes, 1936) Further, testosterone and androstanediol have the progesterone like power to modify the action of oestrone on the rat vagina, resulting in extensive mucification, and, further, they have the progesterone-unlike power to cause mucification directly when given alone to the ovariectomized rat (Korenchevsky and Dennison, 1936) Testosterone also has some effect on the mammary glands (Selye, McEuen and Collip, 1936) The biological significance, if any, of these anomalous activities is not yet obvious Androstanediol (Zuckerman and Parkes, 1936) and also testosterone (Zuckerman, 1936) have the power to protect the male organism from the effects of oestrone

POST-GRADUATE NEWS

The Fellowship of Medicine announces that surgical tutorial classes will be given at the National Temperance Hospital at 8.30 p.m. as follows: March 2, hernia; March 4, intestinal obstruction; March 9, testicle and prostate. The following courses have been arranged: proctology at St. Mark's Hospital March 1 to 6; orthopaedics at Royal National Orthopaedic Hospital March 8 to 20; infants diseases at Infants Hospital March 8 to 13; urology at All Saints Hospital March 20 and 21; chest and heart at Royal Chest Hospital March 1 to 20; neurology at West End Hospital for Nervous Diseases March 8 to 20. A mock trial of a motorist accused of being under the influence of drink will take place on March 11 at 8.30 p.m. Admission by ticket only. Application for particulars of all courses and of the trial should be made to the Fellowship of Medicine, 1, Wimpole Street, W.

WEEKLY POST-GRADUATE DIARY

BRITISH POST GRADUATE MEDICAL SCHOOL, Ducane Road, W.—*Daily* 10 a.m. to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetrical and Gynaecological Clinics and Operations. *Tues.* 4.30 p.m., Dr. Gardiner-Hill: Endocrine Diseases and Disturbances. *Wed.* 12 noon, Clinical and Pathological Conference (Medical). 2 p.m., Dr. King: Calcium Phosphorus Metabolism. 3.15 p.m., Clinical and Pathological Conference (Surgical). 4.30 p.m., Dr. Honor Fell, Tissue Culture. *Thurs.* 12 noon, Clinical and Pathological Conference (Obstetrics and Gynaecology). 2.30 p.m., Dr. Duncan White: Radiological Demonstration. 3.30 p.m., Mr. A. K. Henry: Demonstrations on the Cadaver of Surgical Exposures. 3.30 p.m., Prof. Gilbert Strachan: Malignant Neoplasms of Uterus. *Fri.* 2 p.m., Operative Obstetrics. 2.30 p.m., Prof. E. W. Hey Groves: Fractures. 3 p.m., Department of Gynaecology, Pathological Demonstration.

FELLOWSHIP OF MEDICINE AND POST GRADUATE MEDICAL ASSOCIATION, 1 Wimpole Street, W.—*National Temperance Hospital*, Hampstead Road, N.W. Surgical Tutorial Classes—Tues. 8.30 p.m., Mr. A. E. Porritt: Hernia. Thurs. 8.30 p.m., Mr. T. Meyrick Thomas: Intestinal Obstruction. Tues. and Thurs. 8 p.m., Clinical and Pathological Medical Course. *Royal Waterloo Hospital*, Waterloo Road, S.E. All-day Course in Medicine, Surgery and Gynaecology. *Brompton Hospital*, S.W. Twice weekly, 5 p.m., M.R.C.P. Course. *Royal Chest Hospital*, City Road, E.C. Mon., Wed. and Fri., 8 p.m., M.R.C.P. Course in Chest and Heart. *St. Mark's Hospital*, City Road, E.C. All-day Course in Proctology.

CENTRAL LONDON THROAT, NOSE AND EAR HOSPITAL, Gray's Inn Road, W.C.—*Fri.* 4 p.m., Mr. Archer Ryland, Adventures in the Gullet.

HAMPSTEAD GENERAL AND NORTH WEST LONDON HOSPITAL.—*Wed.* 4 p.m., Dr. H. V. Morlock: Haemoptysis.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—*Thurs.* 2 p.m., Clinical Lecture, Sir Lancelot Barrington-Ward: Indications for Operation in Diseases of the Abdomen. 3 p.m., Clinico-Pathological Lecture, Dr. Reginald Lightwood, Indications for and Interpretations of Bismuth Meals and Barium Enemata. Out-patient Clinics mornings 10 a.m. to 12 noon. Ward Visits afternoons, 2 p.m. to 3.30 p.m.

INSTITUTE OF MEDICAL PSYCHOLOGY, Malet Place, W.C.—*Mon.* 5.45 p.m., Dr. H. V. Dicks: Hysteria. *Wed.* 6 p.m., Dr. A. Hutchison: Early Difficulties and Principles in Training. 7 p.m., Dr. A. Maberly: Case Histories. *Thurs.* 5.45 p.m., Dr. T. Mitchell: Character Formation.

NATIONAL HOSPITAL, Queen Square, W.C.—*Mon.* to *Fri.* 2 p.m., Out-patient Clinics. *Mon.* 3.30 p.m., Dr. S. A. Kinnier Wilson: Congenital and Heredo-familial Diseases. *Tues.* 3.30 p.m., Mr. Jackson Burrows, Orthopaedic Treatment of Paralysis. *Wed.* 3.30 p.m., Dr. Kinnier Wilson, Clinical Demonstration. *Thurs.* 3.30 p.m., Dr. M. Critchley: Vascular Diseases of the Brain. *Fri.* 3.30 p.m., Dr. J. Purdon Martin: Poliomyelitis.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART, Westmoreland Street, W.—*Tues.* 5.30 p.m., Dr. F. W. Price: Heart Disease and Child-bearing.

ST. JOHN CLINIC AND INSTITUTE OF PHYSICAL MEDICINE, Ranelagh Road, S.W.—*Fri.* 4.30 p.m., Dr. C. A. Robinson, Electrotherapy in Rheumatic Diseases.

SOUTH WEST LONDON POST GRADUATE ASSOCIATION, St. James's Hospital, Ouseley Road, S.W.—*Wed.* 4 p.m., Mr. C. D. Read: Vaginal Discharge.

WEST LONDON HOSPITAL POST GRADUATE COLLEGE, Hammersmith, W.—*Daily* 2 p.m., Operations, Medical and Surgical Clinics. *Mon.*, 10 a.m., Skin Clinic, 11 a.m., Surgical Wards, 2 p.m., Surgical and Gynaecological Wards, Eye and Gynaecological Clinics. *Tues.*, 10 a.m., Medical Wards, 11 a.m., Surgical Wards, 2 p.m., Throat Clinic, 4.15 p.m., Mr. Rocher: Haematuria and Bladder Growths. *Wed.* 10 a.m., Children's Ward and Clinic, 11 a.m., Medical Wards, 2 p.m., Eye Clinic, Gynaecological Operations, 4.15 p.m., Mr. Harvey Jackson, Applications of Radiology in Neuro-surgery. *Thurs.* 10 a.m., Neurological and Gynaecological Clinics, 12 noon, Fracture Clinic, 2 p.m., Eye and Genito-Urinary Clinics. *Fri.* 10 a.m., Medical Wards, Skin Clinic, 12 noon, Lecture on Treatment, 2 p.m., Throat Clinic, 4.15 p.m., Dr. Eric Hudson: Pleurisy with Effusion. *Sat.* Children's and Surgical Clinics, 11 a.m., Medical Wards. The lectures at 4.15 p.m. are open to all medical practitioners without fee.

GLASGOW POST GRADUATE MEDICAL ASSOCIATION.—At Royal Infirmary. *Wed.* 4.15 p.m., Mr. James Harper, Sinus Infection.

LEEDS POST GRADUATE CLINICAL DEMONSTRATIONS.—At Leeds General Infirmary. *Tues.* 3.30 p.m., Dr. J. R. H. Towers: Short Paper on the Heart in Middle Age and a Demonstration of Cardiac Cases.

MANCHESTER ANCOATS HOSPITAL.—*Thurs.* 4.15 p.m., Mr. E. S. Brentnall, Common Injuries of the Knee-joint.

MANCHESTER ROYAL INFIRMARY.—*Tues.* 4.15 p.m., Dr. F. F. Tylecote: The Preventive Aspect in Treatment and its Importance in Practice. *Fri.* 4.15 p.m., Mr. John Morley, Demonstration of Surgical Cases.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—*Tues.* and *Thurs.* 5 p.m., Goulstonian Lectures by Dr. D. E. Denny-Brown: The Nervous Control of Micturition and its Disorders.

ROYAL SOCIETY OF MEDICINE

Section of Pathology.—Tues., 8.30 p.m., Laboratory Meeting at Guy's Hospital. Demonstrations, 9.15 p.m., Short Papers.

Section of Orthopaedics.—Tues., 8.30 p.m., Discussion: Prevention and Treatment of Ununited Fractures. Openers: Mr. A. M. A. Moore and Mr. Reginald Broomhead. Followed by Mr. H. A. T. Turbank, Mr. G. R. Girdlestone and Mr. K. H. Pridie.

Section of History of Medicine.—Wed., 5 p.m., Dr. E. Ashworth Underwood: Medicine and Science in the Writings of Smollett.

Sections of Surgery and Radiology.—Wed., 8.30 p.m., Special Discussion: Value of Pre- and Post-operative Irradiation in Malignant Disease. Openers: Mr. W. Sampson Handley, Dr. W. M. Levitt, Mr. G. F. Stebbing and Dr. J. R. K. Paterson.

Section of Otology.—Fri., 10.30 a.m. (Cases at 9.30 a.m.). Paper by Dr. W. J. McNally (Montreal): Labyrinthine Reactions and their Relation to the Clinical Tests. Cases will be shown.

Section of Laryngology.—Fri., 5 p.m. (Cases at 4 p.m.). Short Paper by Dr. McNally: Carcinoma of the Pharynx and Cervical Glands Treated by Deep X-Ray Therapy. Cases will be shown.

Section of Anaesthetics.—Fri., 8.30 p.m., Discussion: Impressions of Anaesthesia in U.S.A. and Canada. Openers: Dr. R. R. Macintosh, Dr. H. W. Featherstone, Dr. Hunter, and Dr. W. S. Sykes.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.—*Mon.* 9 p.m., Lettsomian Lecture by Sir Thomas Dunhill: Surgery of the Thyroid Gland. *Thurs.* 7.45 p.m., Annual Dinner at Claridge's Hotel.

ROYAL INSTITUTION, 21 Albemarle Street, W.—*Tues.* 5.15 p.m., Dr. Edward Mellanby, F.R.S.: Digestion and Indigestion.

SOCIETY OF CHEMICAL INDUSTRY, LONDON SECTION.—At Chemical Society's Rooms, Burlington House, Piccadilly, W., *Mon.* 8 p.m., Prof. F. Paneth: Natural and Artificial Radio-elements and their Practical Applications in Chemical and Biological Research.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—At West London Hospital, Hammersmith, W. *Fri.* 8.30 p.m., Discussion: Diseases of the Colon. Speakers, Dr. A. F. Hurst, Prof. G. Grey Turner and Dr. H. W. Post.

THE BELFAST MEETING, 1937

ACCOMMODATION AND CRUISE ON s s "ALMANZORA"

Reference was made in these columns on January 30 (p 53) to the anxiety of the local committee to meet all the requirements of visitors to Belfast for the Annual Meeting of the British Medical Association next July and also to the advisability of an early application to Messrs Thomas Cook and Son, 27, Royal Avenue, Belfast in whose hands the booking of hotel accommodation has been exclusively placed

To supplement the limited accommodation in an attractive manner, however arrangements have been made with the approval of the Council of the Association, for provision of accommodation on board the s s *Almanzora* During the period of the meeting the liner will be anchored in Belfast Lough in order that members may take a full part in all the social and scientific activities At the close of the meeting the liner will leave Belfast and proceeding via the Inner and Outer Hebrides and Scapa Flow will cruise in the Norwegian Fjords, visiting Trondhjem Merok Hellesylt, Oie and other places of interest The liner will return to Southampton on August 3 This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206 High Holborn W C 1 or at any of their branches

Travelling Arrangements and "Conference" Tickets

As on this occasion the journey to the place of meeting necessitates travel outside the limit of the English railways, arrangements have been made for the issue to members and those accompanying them to Belfast of a special Conference Ticket at the rate of the ordinary first or third class single fare plus one third for the return journey This 'conference rate is more favourable than the special summer or monthly ticket available to all travellers by rail and can only be obtained on presenting a voucher at the booking office of the station of departure The vouchers can be obtained from the Financial Secretary, B M A House, Tavistock Square, London, W C 1, a separate voucher being required for each individual travelling

Members must make their own individual arrangements for sleeping accommodation on steamers crossing to Ireland and Messrs Pickfords help can be sought in this matter Those who propose to travel by the Stranraer–Larne route are warned that on account of the Glasgow Fair holiday traffic little or no accommodation will be available on the steamers operating on this route The railway company however, has offered to provide a special steamer for the benefit of members of the Association provided an early indication can be obtained of the probable numbers travelling To assist the railway and shipping companies concerned therefore, early communication with Messrs Pickfords is urged

Conveyance of Motor Cars

The following details regarding the conveyance of privately owned motor cars accompanying passengers to Belfast have been furnished by the Railway Clearing House

Motor cars accompanying passengers holding not less than one first class or two third class adult tickets per car are conveyed by passenger train between the points for which the tickets are available at the following specially reduced rates at owner s risk

Single rail journeys Minimum 50 miles 3d per mile per car

Return rail journeys Minimum 50 miles (outward journey) 4½d per mile per car on the single journey mileage provided return passenger tickets are taken out and the motor car is booked for the double journey at the starting point

The foregoing arrangement applies in Great Britain only

Privately owned motor cars are also accepted for conveyance between British and Irish ports and charged rate and a half for the double journey at owner's risk provided not less than two adult passengers accompany each car in both directions and that the motor cars travel by the same route on both the outward and return journeys The motor cars are only booked through to the destination shown on the passengers tickets and no break in the journey is allowed Passengers must produce their tickets for the journey before the motor car will be accepted for carriage under these arrangements Arrangements must be made beforehand in all cases

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Captains K H Hole O B E to the *Drake* for Royal Naval Hospital Plymouth G G Vickery O B E to the *Victory*

The services of Surgeon Commander R G Anthony have been lent to the New Zealand Division for three years

Surgeon Commanders A J Tozer to the *Wildfire* A W Cocking to the *Pembroke* for Royal Naval Barracks H Hurst to the *Lucia* D M Beaton to Royal Naval Hospital Plymouth

Surgeon Lieutenant Commanders C T Hyatt to the *Drake* for Devonport Dockyard F Dolan and F W Besley to the *Drake* for Royal Naval Barracks T L Cleave and T G B Crawford to the *Pembroke* for Royal Naval Barracks J J Keevil and D A Newbery to the *Victory* for Royal Naval Barracks

Surgeon Lieutenants C V Harries to Royal Naval Hospital Malta H de B Kempthorne to Royal Naval Hospital Cape of Good Hope

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant G H Sellers to be Surgeon Lieutenant Commander

Surgeon Lieutenants A F Griffiths to the *Pembroke* for Royal Naval Barracks F T Land to the *Iron Duke* P M Inman to the *Victory* for Royal Naval Barracks

ROYAL AUSTRALIAN NAVY

Surgeon Lieutenant Commander C A Downward to the *President* for course

ROYAL ARMY MEDICAL CORPS

Captain J H Anderson to be Major

Lieutenant (on probation) E W O Skinner has been seconded under the provisions of Article 213 Royal Warrant for Pay and Promotion 1931

R D Menzies from Supplementary Reserve of Officers R.A.M.C to be Lieutenant (on probation)

ROYAL AIR FORCE RESERVE MEDICAL BRANCH

Flight Lieutenants M Clancy and L O'Connor have relinquished their commissions on completion of service

TERRITORIAL ARMY

Col A P Watson O B E T D has vacated the appointment of A D M S 52nd (Lowland) Division on completion of tenure

Col F T Rees M C has vacated the appointment of A D M S 53rd (Welsh) Division on completion of tenure

Lieut Col and Brevet Col G J Linklater O B E from general list R A M C to be Colonel and has been appointed A D M S 52nd (Lowland) Division

Lieut Col W H Kerr from general list R A M C to be Colonel and has been appointed A D M S 53rd (Welsh) Division

ROYAL ARMY MEDICAL CORPS

Majors J P J Jenkins and C D Bruce to be Lieutenant Colonels and to command the 158th (Welsh) and the 155th (Lowland) Field Ambulances respectively

Lieutenants T H Dockrell K M Morris and M K Brimbrooke to be Captains

Major A H D Smith M C T D to be Lieutenant Colonel

Lieutenant A D Davidson from 51st (Highland) Divisional Signals to be Captain with seniority May 1 1934

To be Lieutenants N J Nicholson (seniority March 1 1936) G D Matthew

Supernumerary for Service with the O T C—Lieut Col C H Carlton M C to be Brevet Colonel

TERRITORIAL ARMY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

Major W Baxter from active list to be Major

Captain A W Henderson from active list to be Captain

INDIAN MEDICAL SERVICE

The services of Lieut Col D H Rai M C have been replaced at the disposal of the Government of the Punjab as from January 15

The dates of promotion of Lieut Col H S Anand to the ranks of Major and Lieutenant Colonel have been antedated to May 26 1926 and May 26 1934 respectively He qualified for accelerated promotion on September 9 1936

Major G V Ram Mohan to be Lieutenant Colonel

The services of Major R K Misra have been placed temporarily at the disposal of the Government of the United Provinces as from December 30 1936

The services of Captain M S Purvis have been placed temporarily at the disposal of the Government of Burma as from November 21 1936

The services of Captain W Scott have been placed permanently at the disposal of the Government of the Central Provinces as from February 11 1934

NOTES OF THE WEEK

Practitioners of Physical Medicine

The committee of the Group of Practitioners of Physical Medicine of the B M A began at its meeting on February 19 the work delegated to it by the Group Conference of devising some means of improving the status of physical medicine It has decided as a first step to prepare a statement setting out the scope, the methods, and the value of physical medicine and emphasizing the importance to all practitioners of some knowledge of physical methods The committee hopes also to be able to dispel the idea that physical medicine denotes only electrotherapy and to show that an important part of the work of the practitioner of physical medicine consists in the application of the principles of rest and exercise and in the study and practice of the medical aspects of physical education Another problem which the committee considered was the control of the advertisement and sale of electro medical apparatus with a view to reducing the number of extravagant and sometimes even fraudulent claims made by the manufacturers and retailers of such apparatus It had before it some information on the Science Committee's work in connexion with the examination of proprietary preparations, and it proposes to investigate the practicability of some similar scheme for the testing of electro medical apparatus

Consulting Pathologists Group Committee

The Consulting Pathologists Group Committee of the B M A met on February 20 and gave its final approval to the revised schedule of charges for pathological work for insured persons and passed a resolution, for submission to the Public Health Committee concerning charges for the testing of designated milk in accordance with the requirements of the Ministry of Health It devoted considerable time to the question of the effect on private pathologists of the competition of commercial laboratories which are able to advertise the services they offer The discussion of this subject will be resumed at the next meeting Investigations are being made into the methods of payment of pathologists in respect of work performed for private patients in voluntary hospitals, and the committee will consider at its next meeting a report on the replies to a questionary issued to pathologists at voluntary hospitals concerning their remuneration, representation on medical committees, and superannuation

Radiologists Group Committee

The Radiologists Group Committee held its first meeting on February 18 The majority of the questions considered affected the position of radiologists in hospitals One of these for example concerned the use for purposes of litigation of reports of x-ray examination performed in hospitals another was a complaint that in hospitals where pay beds had been established the charge for radiological work was included in the charge for maintenance, while a third was from a radiologist member of the honorary staff of a hospital where private cases were being attended by the whole time staff instead of by the honorary staff The committee accordingly decided to prepare a memorandum concerning the general standing of radiologists in hospitals and their relation to the treatment of private patients who are admitted

Midwifery Schemes

The East Sussex County Council has prepared its midwifery scheme It has been arranged that the Nursing Federation and the district nursing associations affiliated to it shall supply the county council with the names and addresses of the certified midwives employed by them, keep records of the cases, and furnish financial and other returns In return the county council will pay each association a grant of 52 per cent of the approved expenditure in respect of the salaries and allowances of the district nurse midwives and the whole of the expense of whole time midwives after deducting the amount received by the association in fees It is proposed that ninety certified midwives shall be employed for the county, and a scale of fees varying with the patient's income has been arranged

Some details have been received of the Portsmouth midwifery insurance scheme, which came into force on April 1 last The object of the scheme is to enable women within certain income limits to insure against the fees of a doctor whose assistance may be required by the midwife during pregnancy, the confinement, or the lying in period The insurance fee is 7s 6d for a first pregnancy and 5s for each subsequent pregnancy It is payable to the medical officer of health by the patient when she engages a midwife but it does not cover the cost of the doctor's services until twenty-eight days have elapsed from the date of the receipt of the fee The income limit is £160 per annum for a man and wife, £170 for a man and wife and one child, and £175 for a man and wife and two children

THE MEDICAL SECRETARY'S VISIT TO INDIA

The following additional notes have been received from Dr Anderson by air mail from Calcutta The earlier notes appeared in the Supplement of February 6 (p 68)

We left Hyderabad on January 10, arriving at Madras twenty-two hours later, to be met at the station by Sir Frank Connor (president of the South Indian and Madras Branch) and Dr A S Mannady Nayar (honorary secretary) After a short talk concerning the arrangements made in connexion with my visit we went early to bed On Tuesday morning I attended a meeting of the Branch Council and discussed with the members the affairs of the Branch A luncheon given by the president followed and at 4 30 p m I addressed a meeting of the Branch to which representatives of the other medical organizations in Madras had been invited On Wednesday I visited the Eye Hospital under the charge of Lieut Colonel R I Wright This splendidly equipped institution, where the late Colonel Elliot worked for so many years, is, I believe the largest in-patient eye hospital in the world, and is an excellent post-graduate training centre At the time of my visit a number of practitioners from different parts of India were undergoing an intensive course of study Afterwards I visited the Women and Children's Hospital at Egmore, under the charge of Lieut Colonel C M Plumptre I was fortunate also to meet Dr A I Mudaliar, professor of obstetrics and Fellow of the College of Obstetrics and Gynecology and most of the medical staff of this institution, and to have an opportunity of talking with them In the afternoon I had a number of interviews with prominent medical men in Madras, chief of whom were Dr T Sathkopan honorary physician at the General Hospital Madras member of the Madras Medical Council, Dr C R Krishnaswami honorary neurologist at the Government Royapuram Hospital

LINCOLN COUNTY HOSPITAL —(1) Senior H S and (2) J H S Males unmarried Salaries £250 p a and £150 p a respectively
LIVERPOOL DAVID LEWIS NORTHERN HOSPITAL —C O (male) Salary £120 p a
LIVERPOOL HEART HOSPITAL —(1) Hon Assistant P (2) First Assistant
LIVERPOOL WOMEN'S HOSPITAL —H S Salary £100 p a
LONDON COUNTY COUNCIL —(1) A M O s (Grade II) at (a) Fulham Hospital, W (b) Hackney Hospital, E, (c) Highgate Hospital N, (d) New End Hospital Hampstead, N W, (e) St Charles Hospital, Ladbroke Grove, W, (f) St Clement's Hospital Bow Road, E, (g) St Olave's Hospital, Rotherhithe S E (c), (d) and (f) males only Salaries £250 p a each (2) Temporary District M O for Area V, District B (City of Westminster) Provisional salary £150 (3) Part time Consulting Ophthalmologists to (a) Dulwich Hospital, S E, (b) St Giles Hospital S E, (c) Norwood Hospital for Children, S E, (d) Queen Mary's Hospital for Children Carshalton (e) Downs Hospital for Children Sutton Salaries £125 p a each for one routine session
LONDON HOSPITAL E —(1) Paterson Research Scholar and Chief Assistant in the Cardiac Department (2) First Assistant to the Department of Thoracic Surgery Salaries £400 p a and £150 p a respectively
LOWESTOFT AND NORTH SUFFOLK HOSPITAL —J H S (male) Salary £120 p a
MANCHESTER ANCOATS HOSPITAL —Medical Registrar Honorarium £50 p a
MANCHESTER EAR HOSPITAL —R H S Salary £120 p a
MANCHESTER ROYAL EYE HOSPITAL —J H S Salary £120 p a
MANCHESTER ST MARY'S HOSPITALS —(1) Two H S for Whitworth Street West Hospital (2) Two H S for Whitworth Park Hospital Salaries £50 p a each
MANSFIELD AND DISTRICT GENERAL HOSPITAL —R S O Salary £250 p a
MITCHAM WILSON HOSPITAL —R M O Salary £150 p a
NEWCASTLE UPON TYNE EYE HOSPITAL —Senior H S Salary £300 p a
NORTHAMPTON GENERAL HOSPITAL —(1) H P (2) Three H S (3) H S to the Ear Nose, and Throat Department (4) C O Males Salaries £150 p a each
NORTHWOOD URBAN DISTRICT OF RUISLIP NORTHWOOD —Medical Officer of Health Salary £250 p a
NORWICH CITY —R M O to the Isolation Hospital and Assistant M O H and Assistant School M O Salary £450 £550 p a
NOTTINGHAM GENERAL HOSPITAL —(1) H P (2) H S Males Salaries £150 p a each
OXFORD RADCLIFFE INFIRMARY —(1) H P (2) Obstetric H P (3) H S to Ear, Nose, and Throat Department (4) Two H S Males Salaries £120 p a each
PERTH AND KINROSS JOINT COUNTY COUNCIL —A M O (female) Salary £500 £25 £700 p a
PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY —H S (male, unmarried) to the Eye, Ear Nose and Throat Department Salary £150 p a
PRESTON LANCASHIRE COUNTY COUNCIL —(1) Resident Medical Superintendent for Park Hospital Davyhulme Salary £850 £25 £950 p a (2) J H S (unmarried) at Biddulph Grange Orthopaedic Hospital Salary £200 p a
PRINCE OF WALES'S GENERAL HOSPITAL N —(1) J H P (2) Two J H S Males unmarried Salaries £90 p a each
PRINCESS BEATRICE HOSPITAL Earl's Court, S W —(1) R S O (male) Salary £200 p a (2) H P and C O Salary £110 p a
PRINCESS ELIZABETH OF YORK HOSPITAL FOR CHILDREN Shirdwell E —H P Salary £125 p a

WHITEHAVEN AND WEST CUMBERLAND HOSPITAL —H S Salary £150 p a
WORCESTER ROYAL INFIRMARY —H S —Salary £160 p a

CERTIFYING FACTORY SURGEONS —The appointment at Calne (Wiltshire) is vacant Applications to the Chief Inspector of Factories, Home Office, Whitehall S W 1, by March 9

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 47 48 50 51 52 53 54 55 58 and 59 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 56 and 57

APPOINTMENTS

BARNETT Trevor, M D, F R C S, Honorary Assistant Surgeon, Royal Portsmouth Hospital

HUTCHINSON C A F R C S, Assistant Surgeon, Bath Ear, Nose, and Throat Hospital

ROTER R D, M B B Ch, Anaesthetist to the Hospital of St John and St Elizabeth Grove End Road, N W

SUMMERS D V, M B, Ch B, Certifying Factory Surgeon for the Kettering District (Northamptonshire)

TERRY L H, M D, Admiralty Surgeon and Agent for Goodwick Pembrokeshire

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue

BIRTH

GRIBBEN —At Nursing Home, Baghdad, on January 26 1937 to Violet (née Bartrom), wife of Grant R Gribben, M B, Ch B D T M, of Kut, Iraq, a son

DEATHS

BEAUMONT —On February 21, 1937 at Stannary House Stainland Halifax, Yorks, Noel Charles Beaumont M R C S L R C P aged 63 Interred at Stainland Parish Church Cemetery February 24

McDONALD —On February 17, 1937 Katie wife of Dr D T McDonald, South Bank Belford, Northumberland Interred at Belford Churchyard on Saturday February 20

SHEPHERD —On January 27, 1937 suddenly, at his home 4 St Mary's Road, Doncaster Alfred Edward Sheppard, M R C S Eng, L R C P, L S A Lond, in 69th year

(Stanley Medical School) and Dr V Rama Kamath the editor of *The Medical Practitioner* a local medical journal In this way I was able to gain intimate knowledge of many of the problems peculiar to the Presidency During the next two days—namely Thursday and Friday—I had unfortunately to take to my bed when Lieut Colonel G R McRobert professor of medicine at the Medical College kindly looked after me This indisposition interfered with the programme which had been arranged for me and much to my regret I was unable to visit Madura Mysore and Bangalore On Saturday evening we left Madras—a day earlier than was intended—so that I might have a quiet day in Calcutta before beginning what I realized was to be a very intensive spell of work My temporary indisposition unfortunately prevented me from doing all that I would like to have done in the Madras Presidency where we were treated with the utmost kindness and cordiality

Extended Stay in Calcutta

After leaving Madras we spent the next thirty six hours in the train and arrived rather weary at Calcutta on Monday morning During the day I met Lieut Colonel E W O G Kirwan I M S the president of the Branch and Dr J P Chaudhuri, the honorary secretary and learnt in greater detail the way in which my time was to be occupied during our stay in Calcutta My first visit on Tuesday, January 19 was to the Acting Surgeon General Lieut Colonel T Crawford Boyd I M S, and my next to the Presidency Government Hospital under the charge of Lieut-Colonel H E Murray I M S This is an institution of 230 beds with public and private accommodation and it was here that Lieut Colonel Proctor the present dean of the Post Graduate School at Hammersmith officiated for a number of years In the afternoon I attended a tea party of the Branch members arranged in our honour to which had been invited representatives of the Calcutta Medical Club and the Calcutta Branch of the Indian Medical Association In the evening the Branch kindly entertained us to dinner about seventy persons being present but before dinner Lieut Colonel Kirwan and Mrs Kirwan and my wife and I were garlanded On Wednesday, January 20 I visited the Eye Hospital under the charge of Lieut Colonel Kirwan the representative of the Calcutta Branch at the Oxford meeting and professor of ophthalmology at the Medical College Then I met and had a talk with Dr S K Mukerjee honorary physician attached to the Eye Hospital and Lieut Colonel J C De I M S acting principal of the Medical College In the Government group of hospitals in Calcutta there is a medical staff of 116 of whom twenty-four are officials and ninety two non officials which goes to prove that the system of appointing honoraries to these hospitals is firmly established in this Province Treatment in the hospitals is free to all although those who wish and can afford to pay may have private or semi private accommodation for which a moderate charge is made After seeing the Eye Hospital where as in all eye hospitals in India a tremendous amount of work is carried on I paid a visit to the Obstetric Hospital in charge of Lieut Colonel P Fleming Gow, I M S, the Surgical Hospital in charge of Lieut-Colonel F J Anderson, I M S and the Medical Hospital in charge of Lieut Colonel E H V Hodge I was also shown over the physiology department and the pathology department under the care of Dr P De and Dr M N De respectively, and I was fortunate also in meeting most of the members of the staffs of the various departments I visited

In the afternoon my wife and I were the honoured guests of Dr T N Majumdar, president of the Calcutta Branch of the Indian Medical Association, at a garden party which was attended by over 300 medical practitioners There we were both garlanded in the Indian fashion On the morning of January 21 I was shown over the Tropical School of Medicine (which owes its existence to Sir Leonard Rogers) by the director Brevet Colonel R N Chopra I M S and over the School of Hygiene by Dr P D Lal being introduced during the course of my tour to the members of the staff of both these institutions On the following day Dr Chaudhuri took me to Chittaranjan Seva Sedon, a private maternity and gynaecological hospital of 145 beds My pilot round this institution was Dr Bidhan Chandra Roy a former mayor of Calcutta and also a former president of the Indian Medical Association and one of the most forceful and influential medical politicians in India I was then taken to visit the Tuberculosis Hospital of 130 beds at Jadabpur one of the few tuberculosis institutions in India Considering the prevalence of tuberculosis in India there is a deplorable lack of institutional provision The doctor in charge at Jadabpur is Dr K S Roy the present secretary of the Indian Medical Association On Saturday my visits were to the Calcutta Medical School (a private institution) the principal of which is Dr J C Chatterji where licentiates are trained and to the Campbell Medical School a Government training school also for licentiates In the latter institution Lieut Colonel P C Banerjee I M S is acting principal Thus ended a very busy week for it must not be forgotten that in addition to seeing the institutions over which I was conducted and meeting many medical men there I was busy fulfilling the numerous social engagements which had been arranged for me through the kindness of members of the profession in Calcutta

Instead of going to Darjeeling as arranged we prolonged our stay in Calcutta, thus enabling me to devote more time to studying the many problems which I had heard raised during the previous week I occupied the two days which I had set aside for an unofficial visit to Darjeeling in making further inquiries in Calcutta On Monday I had a meeting with a number of the medical men prominent in the Calcutta Branch of the Indian Medical Association and the Calcutta Medical Club chief of whom were Sir Upendranath Brahmachari at whose house the meeting took place Sir Nilratan Sircar Dr B C Roy and Dr K S Roy There was a very useful discussion which lasted for nearly three hours and I came away considerably enlightened as to the views held by the Indian practitioners present at the meeting Sir Upendranath Brahmachari kindly entertained a number of us at dinner later in the evening in the Calcutta Club The next day I visited a rural hospital and dispensary situated outside Calcutta the Sagore Dutt Charitable Hospital and Dispensary the chief medical officer in charge being Dr S N Ghose and in the afternoon I had several interviews with medical men who expressed a wish to see me

Special Problems of Assam

We left Calcutta on January 27 and arrived at Shillong the following day after twenty two hours travelling The first part of the journey was by train to Amingaon which we reached at 5.45 in the morning We crossed the Brahmaputra by ferry from Amingaon to Pandu and continued the journey by motor to Shillong It was a wonderful drive through jungle and mountain scenery along a road with innumerable hairpin bends which neces

COAL-TAR NAPHTHA DISTILLATES FOR DESTRUCTION OF BED-BUGS*

BY

S A ASHMORE, B Sc, A I C.

Government Laboratory

AND

A W McKENNY HUGHES, D I C, F R E S

British Museum (Natural History)

A number of experiments both in the laboratory and in the field have been carried out which show that the vapour of certain coal tar naphtha distillates is lethal to the bed bug (*Cimex lectularius* Linn) Toxicity experiments have also been carried out by Dr G R Cameron at University College Hospital Medical School, London and these tests have shown that animals kept for prolonged periods in an atmosphere saturated with the vapour have not been injuriously affected in any way and afford some considerable assurance that no danger to man from this cause is to be apprehended

A method for applying these naphtha distillates to the disinfestation of houses has been developed and consists essentially in spraying the walls and ceilings of rooms which have previously been made gas tight by any of the usual methods of sealing Special attention is given to likely harbourages such as skirting boards architraves, etc a high pressure hand syringe being used for spraying such harbourages Gas masks with a suitable filter are worn during the process To ensure satisfactory results it is important that sufficient vapour concentration be maintained, and for this purpose fumigation should not be begun at a temperature of less than 60 F It is an advantage to work at as much above this temperature as is practicable

The quantity of naphtha used in the experiments is on the basis of 1 gallon for each 750 cubic feet of room space The rooms are kept sealed for eighteen to twenty-four hours and at the end of this time are rapidly ventilated by opening doors windows fireplaces etc The vapour clears very quickly, and it is possible to enter a room after a few minutes ventilation without experiencing any discomfort It has moreover been shown that there is no tendency for a concentration of vapour to build up if after ventilation the doors and windows are again closed for several hours

The desirability of a high initial temperature is emphasized and only in very hot weather with air temperatures of 70 to 80 F should pre heating of houses be dispensed with In the experiments a very effective paraffin stove, working on the primus principle has been used but in any case sufficient time must be given to warm walls, ceilings, etc, thoroughly Owing to the inflammable nature of the naphtha fires or other sources of heat must be extinguished and, if portable removed from the rooms before fumigation is started and smoking and the use of naked lights must be prohibited while the naphtha is being handled in any way The experiments indicate that after a house has been warmed it is advisable in most instances to spray the roof space before the rooms are treated

Results

Successful results have been obtained in the disinfestation of upwards of two hundred houses and flats of varied constructional detail Failure has been reported in a few cases but this we think has been incidental to the development of a suitable technique for applying the naphtha After fumigation for twenty four hours dead bugs will sometimes be seen on the floors but usually they will be found dead in their customary hiding places —for example behind skirting boards picture rails etc

The naphtha used is derived by the distillation of coal tar, and consists of a complex mixture of aromatic hydrocarbons and associated bodies and the constituent or mixture of constituents which is toxic to the bed bug is not known The following specification has been drafted to govern the supply of coal tar naphtha as used in these experiments

SPECIFICATION FOR HEAVY COAL TAR NAPHTHA

1 *Colour*—Shall not be darker than a freshly prepared solution of 1 ml of N/10 iodine in 1 000 ml of distilled water

2 *Specific Gravity*—Not less than 0 835 and not greater than 0 910

3 *Water*—Shall be free from water and other visible impurities at 15 5 C

4 *Distillation Range*—Method as defined in B S I Specification No 479 for Coal tar Naphthas

Up to 160 C not more than 5 ml
Up to 190 C not less than 90 ml

5 *Flash point (Abel)*—Not less than 105 F

6 *Tar Acids and Tar Bases*—Not more than 0 25 per cent of tar acids and 0 25 per cent of tar bases

Further research into various aspects of the question of the use of heavy coal tar naphthas for the destruction of bed bugs is in progress and new methods for more effective application are in course of development As will be seen from these preliminary notes the use of coal tar distillates for the destruction of the bed bug is still in the experimental stage, but the results so far achieved are promising and indicate that further research on these lines may produce valuable results

As was to be anticipated failures have occurred, not however owing to defects in heavy naphtha as a toxic agent for destruction of bed bugs, but owing to defects in the methods of employing it for that purpose If therefore, those responsible for the management of house property adopt this method of treatment for eradication of bed bugs it is important that they should realize that the technique of fumigation with heavy naphtha is still the subject of test and research and that the cause of any failure is first to be sought in the method used In the event of failure the circumstances of the particular case should be carefully investigated especially in regard to the temperature at the time of fumigation to the sealing of the premises and to the distribution of the vapour

* Abstract of a report to the Bed bug Infestation Committee of the Medical Research Council

---

The eighth International Congress of the Haute Culture Médicale will be held at Algiers from March 25 to April 6 There will be sessions on tropical and subtropical diseases syphilography and dermatology cardiovascular affections blood disorders, and social medicine During the congress there will be a special commemoration of the pioneers in the campaign against malaria and also excursions receptions and entertainments in the first of these which will be broadcast Dr P H Manson Bahr will participate At the end it is hoped to arrange visits to Morocco and Tunis The travel arrangements are in the hands of Messrs Cook Wagons lits and further information can be obtained from the congress secretary M Tomarkin Institut Alfred Fournier 25 Boulevard Saint Jacques Paris XIV

sitates strictly regulated one way traffic In the latter part of the drive we passed through a large patch of tall stately pine trees and arrived at the appropriately named Pinewood Hotel, about 5 000 feet above sea-level "travel weary and hungry We were met by Lieut-Colonel L A P Anderson I M S, who is in charge of the Pasteur Institute over which I was conducted in the afternoon The next day I visited the Civil Hospital under the charge of Major R A Haythornthwaite, I M S, and in the evening addressed a meeting of the medical practitioners in the district, about twenty being present

We left for Gauhati the following day, travelling over the road by which we had come two days before and at Gauhati entrained for Mariani which we reached at 7 40 on Sunday morning Dr Ramsay and Major Lockwood Stevens, both of the Ross Institute, and Mrs Stevens joined the train en route, and we were met at Mariani by our hostess Mrs Manson, the wife of Dr Manson of Cinnamara, Dr Lampiell, honorary secretary of the Assam Branch, and Dr Macdonald of Mariani A drive of nine miles followed to our destination at Cinnamara, which is situated in the tea district of the Assam Valley On Monday I was driven round the area of Dr Manson's practice and thus had an opportunity to see at first hand the various biological control measures which have been adopted to combat malaria I also visited the Central Estate Hospital and the Experimental Station of the scientific department of the Indian Tea Association at Tocklai The next day, Tuesday was the first of a three days annual general meeting of the Assam Branch of the British Medical Association, at which twenty-two members about one third of the membership of the Branch, turned up The Branch is a real live body, and shows great interest in the scientific, ethical and medico political problems peculiar to the district I was privileged to address the members, and was immensely struck by the keen interest shown in every item of the agenda Many men had travelled hundreds of miles to be present, and the spirit of camaraderie was very pleasing The meeting which was under the presidency of Dr Whaley, terminated in the evening of the third day with a dinner, to which many of those interested in the management of the tea estates in the locality were invited

We left Mariani at 2 46 a m on Thursday February 5, for the Surma Valley

During the journey we passed through some of the most magnificent hill jungle scenery in Assam before we reached our next halt at Lalbag in Cachar Dr Fraser who was our host for the next two days showed me a number of interesting patients suffering from a variety of tropical diseases who were being treated in the Lalbag Central Hospital and explained as he conducted me round the tea garden the preventive measures against malaria and dysentery etc which are being carried out in the neighbourhood On Sunday we motored into Silchar when I had the good fortune to meet eight of the members of the Division some of whom had travelled considerable distances by train and car Silchar is an interesting place if only for the fact that it was there that the first polo club in the world was started Leaving Silchar on Sunday evening February 7 we arrived in Calcutta again the next morning after a journey by train to Chandpur by steamer to Goalundo on the River Padma and then by train again Our visit to Assam left me much impressed by the preventive measures which are being adopted by the local tea estate managements on the advice of their medical officers to safeguard the health and well being of the coolies who are employed in such large numbers The next three days we spent in Calcutta when I was privileged to see over the Ramkrishna Sisumangal Pratishthan a maternity hospital and child welfare centre, and the Carmichael Medical College As arrears of note-recording and correspondence required to be tackled I was glad to be able to devote some time also to this before we left on Thursday morning, February 11, for Patna in the United Provinces Of the hospitality and kindness received in Calcutta and in Assam my wife and I cannot speak too warmly

PUBLIC HEALTH NOTES

Acute Poliomyelitis

A revised version of an earlier memorandum on poliomyelitis has recently been issued by the Ministry of Health [Memo 166/Med (revised)] It deals with the pathology epidemiology, clinical character, diagnosis and treatment of the disease, In the study of its epidemiological features it is suggested that "infection may be spread directly not only by patients but by persons apparently healthy," and that though the incubation period is variable its average length is three to four days

Dealing with the clinical character of the illness the memorandum describes the three stages the initial, the pre-paralytic and the paralytic The initial stage, which may be followed by no other or may, and more commonly does, merge into the second phase, is indefinite comprising the signs and symptoms found preceding the exanthemata If present the signs in the pre paralytic stage are pyrexia, headache, pains in the back and limbs, stiffness of the neck and spine, muscular twitchings, and hyperaesthesia Two signs are mentioned as an aid to diagnosis The first is the spinal sign

'The patient is disinclined to bend the head forward on account of pain experienced in doing so and there is resistance to passive anterior flexion of the neck When the patient is raised by the shoulders the head falls backwards and the patient cannot easily bring it forward again A simple way of eliciting the spinal sign is to ask the patient to kiss his knees'

The second is Amoss's sign, which is useful in the case of older children

> When placed in the sitting posture and asked to fold his arms the child may attempt to do so but quickly reverts to the position in which part of the body weight is borne by the arms which thus make two legs of a tripod, the spine being the third '

The cerebro-spinal fluid at this stage is usually under moderately increased pressure, colourless, or slightly hazy in appearance, with a cell count of 50 to 250 per c mm with an increase in mononuclear and polymorphonuclear cells In the poliomyelitic form the last stage is reached by the paralysis coming on usually three or four days after the onset of the illness, appearing as a flaccid paralysis affecting one or two muscles or a group of muscles or one or more limbs When the upper motor neurones are chiefly affected the polioencephalitic form is seen, this being more commonly found in children over the age of 5 years As regards treatment reference is made to the use abroad of convalescence serum The reports, however are as yet inconclusive

The patient is assumed to be infectious for six weeks and children from affected households should be excluded from school for three weeks from the date of isolation of the patient, although no restriction is placed on apparently healthy adult contacts continuing their occupation

SURGERY OF THE THYROID GLAND

LECTURES BY SIR THOMAS DUNHILL

The first two Lettsomian Lectures, under the auspices of the Medical Society of London, were delivered on February 15 and 24 by Sir THOMAS DUNHILL, K.C.V.O., whose general subject was the surgery of the thyroid gland.

In his first lecture Sir Thomas Dunhill remarked that the thyroid gland had only once before provided the theme of the Lettsomian Lectures, and that was twenty-four years ago, the lecturer being Mr (now Sir) James Berry. It was just thirty years since he himself performed his first operation of partial thyroidectomy for toxic goitre. In the course of thirty years opportunities for testing theories and practice had multiplied, and he apologized to his audience for giving a few minutes to personal reminiscences, which constituted his own historical background to the subject.

The circumstances of his first operation were of some interest. He had at that time about half a dozen toxic goitre patients in the out-patient department. One of these was a cook who had become far too ill to earn a living and said that any risk was preferable to her wretched existence. A kind senior lent him a bed, and the operation was successfully performed on this woman, with the result that the other patients, one after another, asked him to operate on them.

Early Operations

At that time (1907) and for long afterwards surgeons were writing that resection of one lobe together with ligation of an artery of the opposite side was a cure for the majority of patients. He soon realized that his own experience differed from theirs, and that if anything approaching cure was to be obtained the amount of gland remaining had to be further diminished by resection of a portion of the second lobe. It became his practice, as he reported in the *British Medical Journal* in 1909, to resect as much as possible of both lobes. In those early days the amount of gland to be removed to obtain maximal relief could only be learned by experience. Sometimes even at the second operation an insufficient amount was taken and a third operation became necessary. Through such stages was it necessary to pass before it became the custom to perform the bilateral resection in one stage in all patients for whom it was deemed safe. His first operative death was in the same year (1907), and the superstitious might observe that it followed his thirteenth operation. It was due to the same cause as the majority of such deaths at the present day—namely, a misjudgement of the capacity of a very ill patient to withstand a double resection in one stage.

Evolution of the Goitre

Apart from inflammation and malignancy—and he doubted whether malignancy should be excluded—all goitres begin as hyperplasia, and the different types of goitre were only stages in a pathological sequence, which was inevitable as soon as hyperplasia began. Probably the thyroid was singular among the endocrine glands in that normal physiological activities so readily crossed the borderline and became pathological. The commonest deviation from the normal was a symmetrical enlargement of the gland noticed most often at or soon after puberty. He said "or soon after" because hyperplasia at puberty might be slight with a quick return to normal. But when the hyperplasia began to be replaced by colloid storage increase in size became obvious and the stage was set for all the processes that followed.

The hyperplasia was induced by the normal demands of the body on a subefficient gland. Its significance was that in many instances recurrent phases of hyperplasia and involution led ultimately to secondary toxic goitre. The enlargement seen in adolescence might be scarcely more than physiological, though the fact of the enlargement indicated that the epithelium was vulnerable. The single nodule was usually of altogether different origin and character. It was an adenoma, a true neoplasm, not necessarily single but usually so. The statement had been made that thyrotoxicosis could exist without a goitre, but this was extremely rare. He suggested the terms "diffuse toxic goitre" and "nodular toxic goitre". The disease was essentially the same in that some stimulus had affected the thyroid epithelium and induced an alteration such that it became toxic.

In primary toxic goitre, occurring at all ages, in the majority of cases around the third decade of life, the stimulation was applied to a gland hitherto normal. The gland had its full complement of normal epithelium. Nothing hindered the whole of this from responding to stimulation—the "factory" was set for maximum output. Exophthalmos was usual because of the amount or toxicity of the secretion. Such a case was to be contrasted with the patient in whom a small goitre had been present for twenty years, becoming more toxic in the fifth or sixth decade. He could show every intervening stage, both clinical and pathological, linking up the two extremes. What he was not sure about was whether goitres apparently not toxic for many years and then becoming so might not have been mildly toxic from an early stage.

Incidence and Aetiology

The deaths from toxic goitre in England and Wales had increased from 812 in 1925 to 1,561 in 1935. This rise in a decade was rather startling. At Liverpool Dr Robert Kemp had recently stated that thyrotoxicosis was by far the commonest condition in the female medical wards of the Royal Infirmary. The aetiology was difficult to determine. The multiplicity of the alleged causes might well make one doubt the essential significance of any of them. They ranged from emotional frustration to business anxieties, from motor accidents to endocrine imbalance, from infections to vitamin deficiency, from heredity to some personal or sex factor. Some factors, however, were so often associated with the inception of the disease and so influenced its course that they could not be ignored. Might it not be that the thyroid gland took the brunt of the buffeting of life? The endocrine glands were the delicate buffers and springs taking up and adjusting shocks. The factors to be considered were (1) the gland, (2) heredity, and (3) the stress of life.

It had already been shown that the gland was responsive to stimuli to an extent that could be demonstrated and made the subject of experiment. Few patients who carried a small goitre into middle life escaped the development of toxic symptoms. As for heredity, toxic goitre frequently occurred in several members of a family. He had several times seen it in three sisters. The quality of the protoplasm was handed down as certainly as the characteristics of the Hapsburg face. As for the stress of life, the changes that were induced in all subefficient glands by the biologically high but still normal demands of life were not in doubt, and efficiency might be vitiated in an individual by, for example, lack of iodine or vitamins.

For many years it was argued whether or not thyrotoxicosis was essentially a disease of the thyroid gland. Many believed it to be a disease affecting the body more widely. One physician went so far as to write that it was as logical to remove the kidney for albuminuria as to resect a portion of the thyroid gland for Graves's disease. There was much dogmatic statement on both sides, and there might not have been so much progress had not thyroid surgeons pressed their views with some vigour. It was necessary to take stock of the position and see where the truth lay. Shocks, anxieties and infections were experienced and the hyperplastic gland resulted,

In regard to residential schools it is stated that the balance of advantage is in favour of *not* closing the school on the appearance of poliomyelitis Those in attendance on the patient are advised to take such precautionary measures as are dictated by the assumption that the secretions from the nasopharynx the urine and the excreta are infectious Spraying or douching the nose and gargling the throat with normal saline or potassium permanganate is recommended while reference is made to spraying or inhaling into the nostrils sodium alum tannic acid, or picric acid

Future of General Medical Practice

In his inaugural address as President of the British Medical Association at the Annual Meeting at Oxford Sir Farquhar Buzzard envisaged central boards representative of all interests and institutions concerned with the health of the district whose chief duty would be that of co ordinating all the preservative preventive and curative services within the district Whilst admitting that 'the saving of life has become the job of institutional team work' he submitted that the saving of health and the prevention of illness in the long run of far greater interest to the welfare of the community must be initiated by the general practitioner in the home Moreover for this work to be performed efficiently it was essential that the staffing of those medical services preventive and curative which had passed into the hands of local authorities should be by general medical practitioners It should be the obligation of the health centre in its capacity of co ordinator of all services public as well as private to make sure that general practitioners are rightfully regarded and employed as priests of preventive medicine

At what was considering the importance of the subject a very meagrely attended meeting of the Society of Medical Officers of Health Dr Charles Hill Deputy Medical Secretary of the Association, opened a discussion on the future of medical practice Basing his case on the Association's proposals for a general medical service for the nation he visualized that development would be on the ground work of the national health insurance scheme The defects of the present service were considered—namely that it was a general practitioner service only a defect to be remedied by making provision for consultants and it applied only to a section of the community not being extended to the dependants of the insured The gap left in this latter respect was being filled to some extent by public medical services provided on an insurance basis but more so by the activities of local authorities an arrangement he submitted which was not in the best interests of the community The administration of the more comprehensive scheme should in Dr Hill's opinion, devolve on the larger local authorities, and to ensure success some changes in medical education would be necessary

Dr Maitland Radford medical officer of health for the metropolitan borough of St Pancras put forward the case for the development of full time salaried services He contemplated the necessity for full time services on economic grounds, as he failed to see how the independent doctor could carry on indefinitely Sir Farquhar Buzzard also referred to the economic aspect in the address already mentioned He said

> The chief flaw in a badly organized service such as that which had evolved in this country during the last century was lack of time and both the general practitioner and the consultant in order to earn a living wage were frequently obliged to undertake far more work than they could deal with efficiently in the hours at their disposal Under the present system it would be necessary to double the number of doctors in order to obtain an adequate service and such a measure would rapidly lead to their starvation That in a world was the problem and if the community could afford to support 100 000 instead of 50 000 doctors every effort should be made to ensure that time and energy as well as money were not wasted in any system of service

Dr Alfred Cox an opponent of any development on the lines of the clinic system submitted that general medical practice must be based on a contract scheme as it was unsound that the practitioner's remuneration should be dependent on the illness of his patient Sir Francis Fremantle was in favour of the incorporation of the general medical practitioner in the health services of local authorities He spoke from his experience as county medical officer for Hertfordshire of the efficiency of the part time medical officer of health who from his intimate touch with the people in their homes possessed real advantages in carrying out preventive work over the full time medical officer of health He deplored the fact that in the education of the medical student the preventive aspects of medicine were insufficiently emphasized He saw no remedy for this except as a result of action by the General Medical Council which would ensure that those responsible for the education of the future doctors were recruited to some extent from persons other than those whose interests lay solely in curative medicine

Public Health Appointments

The following changes have recently been made in the public health medical service staffs

Dr J L Bevan medical officer of health for Hebburn to be medical officer of health for Barnsley

Dr Kathleen S Bruce to be deputy medical officer of health and assistant school medical officer for Keighley

Dr T J Hennelly to medical superintendent of Cardiff Mental Hospital

Dr H J L Mackinven to be medical officer for the Morven district of Argyllshire

Dr R R H Mitchell assistant medical officer at Westgreen Asylum Dundee to be senior medical officer at Springfield Asylum

INSURANCE MEDICAL SERVICE WEEK BY WEEK

Sending to Hospital Without Examination

The following note may be appended to those given last week on hospital problems

An insured person was involved in an accident and received a shock but did not feel that he had sustained any injury He continued to follow his employment but on December 20 an attack of rheumatic gout developed and his hands and feet became very swollen and painful His wife went to the practitioner's surgery at about half past ten in the morning on that day She produced her husband's medical card and after giving the practitioner the above details requested him to visit the patient She also showed the practitioner a letter which she was sending to her husband's employers in respect of her husband's accident insurance The practitioner read the letter and advised the messenger to take her husband to a hospital for an x ray examination in order to ascertain whether there were any broken bones The wife explained to the practitioner that it was not possible for her to comply with this suggestion but he merely repeated it and said that he could do nothing for the patient until the x ray examina

but these stimuli reached the thyroid by way of a hormone which originated in the anterior lobe of the pituitary gland, so that the thyroid, although the effect there was obvious, was only indirectly affected Nevertheless it was the thyroid which produced the secretion causing the manifestations associated with toxic goitre

Need for Continual Observation

The course of the disease was familiar, but the lecturer wondered whether the havoc which toxic goitre played in the life of the individual or the amount of life it wasted was realized

He instanced the case of a woman patient whose practitioner had always accepted the condition as natural She suffered always from epigastric discomfort and sometimes vomiting which was put down to persistent indigestion The patient was always keyed up driven by some remorseless internal restlessness There was no placidity with her and the nerves were always raw She was a married woman but in consequence of what the husband thought to be her temperament domestic happiness was ruined Her doctor was not willing to admit that what he regarded as a simple goitre could be at the root of the trouble At length she met a friend who had been through a similar experience and by appropriate treatment it was possible to improve her condition though unfortunately not to restore the domestic situation

He instanced another patient whom he saw in September last This man said that he did not feel ill, and asked to be allowed to go on with his sedentary occupation until after Christmas He turned up at the hospital in February with a pulse rate of 140 to 150, and his weight was 6 st 6 lb, a loss of 4 st in four months on the top of the 1½ st which he had lost previously

Making every allowance for those restored to health by medical measures there remained an incalculable amount of suffering and mortality that could be avoided He was not recommending every case for operation, but he urged that any patient with this condition should never be allowed to escape observation and at the first sign of any downward tendency active measures should be taken

(To be continued)

THE HUNTERIAN TRADITION

ORATION BY LORD HORDER

At a meeting of the Hunterian Society at the Mansion House, London, on February 22 Lord Horder delivered the annual Oration, on *The Hunterian Tradition* The president of the society, Mr H L ATTWATER was in the chair

Lord HORDER opened by saying that it was a compliment to him, a physician, to be asked to give an address on John Hunter, a surgeon, but Hunter was a physician as well as a surgeon, a better physician indeed, than some of his contemporaries who practised in that branch of medicine, and he was more than either of those things, he was, first and foremost, a pathologist a man who sought out the causes and nature of diseases He was also a great anatomist and physiologist, making his researches so wide as to embrace the whole of the animal kingdom But his chief distinction was in pathology, not so much a branch of surgery as its root, which before Hunter's day scarcely existed

After he had chosen the title for his address he discovered that it had already been used by a Hunterian Orator before the Royal College of Surgeons, Sir D Arcy Power, who had said that Hunter left a double legacy to medicine first the technical skill which he bequeathed to his pupils and secondly the pathological trend which he gave to the study of surgery, and through which for the first time it became a living thing, moving away from pure empiricism and emerging as an art based upon accurate knowledge and guided by principles Lord Horder said that it was the second of these which had been in his mind when he elected to speak on the Hunterian tradition He was not qualified to say much on Hunter's technical ability as a surgeon It might have been exceptional even in his day, when a quick and accurate manual dexterity being of so much greater consequence to the life of the patient than in these days of expert anaesthesia and antisepsis, this was more general among surgeons than now But Hunter's personal gifts in this direction did not appear to have attracted special notice and were of far less moment than his achievement in opening up the vast field of pathology which laid the foundation of the surgery of the future It did not seem that he had introduced much in the way of new operative procedures, though an exception was his method of curing aneurysm of the popliteal artery, saving thereby thousands of limbs and lives in this operation he united the multitude of facts he had gained from his study of anatomy and physiology, his clinical experience his post mortem examinations, and his experiments on animals

The Real Greatness of Hunter

The real greatness of Hunter however, was that he called a halt to empiricism, dug the heels of reason in and asked disturbing questions What is it we are doing and why? Here was the essence of the Hunterian tradition In his attempts to answer these questions Hunter not only raised the level of surgery to a plane it had never reached before but gave impetus to inquiries that awakened the whole of medicine What was surgery before Hunter? In these days when surgeons had taken such high rank among them there was a savour of quaintness in Paget's eulogium, when he said that before Hunter the surgeon held a subordinate place in the medical profession, generally inferior to the physician, who was a man of higher culture an educated gentleman and associate of gentlemen The physicians then were the teachers of all the medical sciences, teachers even of anatomy to the surgeons But following Hunter in the pursuit of science surgeons soon became the chief anatomists equal as physiologists and pathologists and gained entrance into the ranks of the most educated classes Yes Hunter did more than anyone to make us surgeons gentlemen, so wrote Paget, himself one of the greatest gentlemen of them all

Before Hunter came to London to join in the work of his brother William's dissecting school he was a cabinet maker, and doubtless a very expert one But had he been only a surgeon who collected specimens he would have remained in spirit a cabinet maker He was responsible for that other stream of influence which brought about the development of surgery in its physiological aspects and its investigations into the causes of disease and this was the part of the Hunterian tradition which really mattered

Hunter's Inductive Method

In his oration before the Royal College of Surgeons Sir Henry Morris had discussed whether the mind of this pioneer worked mainly by the process of deduction or of induction Some critics had considered that those two philosophic methods were in a sort of conflict leading to confusion of thought and obscurity of language and appeared to have stressed unduly the tendency of the Scottish thinker to proceed deductively and of the English thinker to proceed inductively It might be conceived that a Scotsman living in London would find his native mental equipment considerably embarrassed But experi

tion had been made and the result reported to him She then left the surgery and as her husband required medical attention she obtained the services of another doctor under whose care the patient remained for some time

The Medical Service Subcommittee in the course of its report said

It might be urged on behalf of the practitioner that at the worst all that he did in this case was to commit an error of judgement in that the condition of the patient was not such as to require an x ray examination There would be some force in this contention if the practitioner had first of all seen the patient and satisfied himself that a reference to a hospital was necessary In our opinion the real fault on the part of the practitioner arose in his failure to attend the patient before giving the advice which he did

This case merely points out, though it hardly needs demonstration, that a doctor who is summoned to visit an insured person must make an examination before he sends the patient to hospital The committee censured the doctor, required him to refund the fees of the other doctor who was called in, and made a recommendation to the Minister as to a deduction from the practitioner s remuneration

Certification

Here is a note of a case in which the Insurance Committee contented itself with reminding the practitioner of the necessity for the strict observance of the medical certification rules The extract is from the report of a Medical Service Subcommittee

An insured person was certified to be unfit for work on August 12 1936 by the locumtenent who was at that time acting on behalf of the insurance practitioner The locum tenent in error completed an intermediate certificate instead of a first certificate The insured person remained under treatment by the insurance practitioner but did not ask for further certificates of incapacity until on or about September 12 1936, when she informed the practitioner that the secretary of her approved society had instructed her to ask for a first certificate in exchange for the intermediate certificate On that day the practitioner declined to issue another certificate, but subsequently on September 15 the insured person again visited the practitioner and informed him that she had consulted the secretary of her society who had instructed her to ask for a first certificate dated August 12 1936 and weekly certificates for the intervening period The practitioner handed to us a communication addressed to him by the secretary of the society in which he was asked to exchange the intermediate certificate for a first certificate Intermediate certificates dated August 19 and 26 and September 2 and 9 were issued by the insurance practitioner all on the same day

The practitioner told us that when he issued the revised certificate dated August 12 1936 the insured person took it to her society and returned in the evening of the same day saying that the society required intermediate certificates for the intervening period The insured person had been seen by him at least once a week for the period in question and as he was satisfied that she had been continuously incapacitated he issued the certificates as he thought in accordance with the request of the society, the insured person having told him that the approved society would not accept a voluntary certificate covering the whole period

The circumstances attending this case differ somewhat from other cases of irregular certification with which we have had to deal Clearly there could be no intention on the part of the practitioner to mislead the society and it is perhaps fortunate that messages should have been conveyed from society to the practitioner by an insured person who the society says experience difficulty in understanding English At the same time the practitioner signed statements in the intermediate certificates which were clearly misstatements of fact as regards the dates on which they were signed Whatever message may be delivered to an insurance practitioner he should remember that the medical certification rules obviously do not permit of his signing statements which he knows are incorrect

We have before referred to the practice, which has now become widely established, whereby societies clear up what are obviously misunderstandings by approaching the practitioner direct instead of calling for a formal *inquiry* by the Medical Service Subcommittee It seems reasonably clear that this is a case which might have been so settled

Another certification question in which there is frequent misunderstanding deals with the necessity for the issue of an ordinary certificate of incapacity whether the insured person is entitled to sickness benefit or compensation It is the doctor s duty to certify incapacity without regard to the nature of the claim which the insured person may make The secretary of the society in this particular case stated that he was prepared to accept the doctor s explanation, and so far as he was concerned the matter was now closed, but he added that he was continuously meeting the "misapprehension" that where compensation is in question panel certificates are not required, and many members have been held in arrears owing to the absence of necessary evidence of incapacity Even after this lapse of time since the Act started some doctors refuse to issue Form Med 40 in cases of accident, although they do not charge for the alternative certificate

Investigation of Prescribing

It is understood that the Minister has decided to refer to Panel Committees a somewhat larger number of cases than hitherto, in the belief that even if in a particular case the extent of any excess found may not be held to justify the withholding of money from the practitioner, the discussion between the Panel Committee and the practitioner will be productive of good, particularly in assisting the latter in his methods of prescribing

With regard to the costs of prescriptions generally it will be remembered that two resolutions of the Annual Conference of Panel Committees stand referred to the Insurance Acts Committee They are as follows

That this Conference is of the opinion that every effort should be made to devise more efficient means for the examination of the orders issued for the supply of drugs etc the prevention of waste and extravagance, and for safeguarding the limited funds available for the provision of drugs and that the Insurance Acts Committee be asked to take as soon as possible such steps towards this end as it considers necessary

That this Conference is of the opinion that the *National Formulary* for national health insurance purposes prepared by the Insurance Acts Committee and issued with the concurrence of the Ministry of Health is sufficiently comprehensive to cover the medicinal treatment of the majority of conditions with which the insurance practitioner has to deal and that a more general use of the *Formulary* would result in a considerable reduction in the cost of supplying insured persons with drugs without reducing the therapeutic efficiency of the treatment given

WITHDRAWAL OF AUTHORIZATIONS SUSPENDED

The Home Secretary has suspended until further order the the operation of the notice published in the *London Gazette* and *Edinburgh Gazette* on April 30 1935 withdrawing from John Alexander Ross M B B Ch now residing at Erskine Terrace Aberdeen the authority granted by the Regulations made under the Dangerous Drugs Act 1920 to duly qualified medical practitioners to be in possession of and to supply raw opium coca leaves and Indian hemp and the drugs and preparations to which Part III of the Act applies and has also suspended the direction given at the same time that it should not be lawful for Dr Ross to give prescriptions for the purposes of those Regulations

ence, of which there was quite a large amount, did not support that view Of course Hunter was chiefly inductive in his methods Most of the great minds in medicine had been inductive Here Lord Horder for a moment traced the influence of Plato and the metaphysical outlook upon medicine Had it not been that Hippocrates or the Hippocratic school was the contemporary of Plato and Aristotle and not their successor the world would probably have been denied not only the meagre discoveries of Hippocrates but the much more important stimulus which he gave by his example and what was termed the "Hippocratic method" But even Hippocrates was compelled to be largely deductive for the reason that medical science was not then born The metaphysical outlook on nature paralysed medicine for more than a thousand years, and would have done so longer had not Francis Bacon burst open the prison door through which, strangely enough, his namesake Roger three hundred years earlier had somewhat dangerously leaped The stranglehold of the metaphysician was too great for Celsus and even for Galen, for though the latter made some anatomical discoveries of importance he constructed dogmas and theories from the most meagre facts, and such was his reputation that he dominated medicine all through that evil time It was Bacon who led the way out of the morass, though he did not himself walk in it He was the great interpreter of the change in thought and activity in relation to the world of nature The world had agreed to date from Francis Bacon the systematic reform of natural philosophy

An analysis of Hunter's excursions into the deductive method would show that this was not really suitable to his mind Was not Hunter's mind in his face? Reynolds's masterpiece and the lovely statue in the Oxford museum alike showed the massive features square protruding jaws, prominent nose, strong determined mouth, and peering eyes Here was one who like Browning's Paracelsus, "must know" Some of Hunter's generalizations from observation and experiment had proved themselves to be sound and even prophetic For example, he concluded that anatomical abnormalities were an expression of arrest of development. He might be said almost to have anticipated Darwin in his teaching that structure was an expression of function He was fond of teaching that blood was alive, and although he seemed to be flirting with an old fantastic speculation he had nearly stumbled on a modern conception, and he got near to Pasteur and Lister in saying that air in itself had no power to cause inflammation

Master and Pupil

Lord Horder read extracts from Hunter's correspondence with Edward Jenner, further to illustrate his mind Jenner's own great discovery was not made until three years after Hunter's death but the stimulus and encouragement which Hunter gave his pupil might well have played a big though indirect part in this first and perhaps greatest step in preventive medicine What a contrast between these two men—the pertinacious Celt, raw and rugged in body and mind, lit by a constant flame of inquiry after knowledge and more knowledge, and the blue eyed, handsome, easy almost debonair Saxon, spending his days booted and spurred riding to hounds, and in the evening writing love verse How Jenner must have resented at first the disturbing demands of his master, until he too became fired by the same spirit and found that the chase of nature's secrets was more engrossing than the sport of kings To Jenner when he was disappointed in love came Hunter's consolation 'Let her go Never mind her I shall employ you with hedgehogs"

Of Hunter's teaching ability he must not stay to speak, but this, like his craftsmanship, was a minor matter His pupils, with some exceptions, were not greatly impressed by his personality in the lecture room Attendance was so scanty that on one occasion he had the skeleton brought in so that he might be able to say "Gentlemen" But those empty benches did not really matter The few who listened were enough, and even the skeleton "talked" after Hunter's lecture

So, after two hundred years, the Hunterian tradition came down to us What were we doing with it? Could we carry it on? Institutions were doing their utmost to carry it on—the Hunterian Society, the Royal College of Surgeons, with its enlarged laboratories and the Buckston Browne experimental farm—but what of themselves as individuals? Had they Hunter's power of concentrated industry, his capacity for taking pains? Lord Horder said that when he watched his colleagues in the van of research he felt ashamed of the laziness of his own mind and the ease with which it yielded to discursiveness Had they Hunter's inquiring mind, his lust to know for the sake of knowing, his intellectual courage, his spirit of accuracy, his divine discontent with any proof except that which carried inescapable conviction?

"And What About Ourselves?"

Perhaps they were saying that there was very little now to be found out They knew all about hedgehogs Did they? They were in a different part of the field, of course, for these pioneers had made a tremendous clearance But there was probably as much to be done as ever, though of a different kind

"To recognize the factors which go to make a balance or imbalance of the hormones and get control over those delicate adjustments—surely Hunter never had a task like that To solve the riddle of endocardial infection, to understand the mechanism of high and low arterial pressures, to diagnose cancer before as yet it yields what we call physical signs or suggests its presence by recognizable deviations from the average in the radiologist's shadow pictures, to determine how to prevent a whole heap of diseases which once established we cannot cure—do we excuse ourselves because we cannot say all these stand open or we have the keys?

'Let us think of our tools our technique, our team work our researches We have instruments of precision that Hunter never guessed at and laboratories of which he never dreamed and a corpus of knowledge to draw upon that was completely hidden from him In his day there was little physics and less chemistry So let us not try to escape from our tasks or our reasonable obligations No doubt we are deflected a good deal from our main purpose Man must be dominated by his age Life has us by the throat We are caught between instinct and reason We have let go the former but have not got a clear hold on the latter We are not savage, but neither are we sapient yet'

He had hope that much might be done—if only the politicians could keep the ring He supposed the politicians did know how vital these things were to all of them and to the future When Pitt was asked to buy Hunter's collection he replied "Why, I have not enough money to purchase gunpowder" History was repeating itself But even dictators were transient if not trivial, whereas these other things were eternal And surely it was better to know the behaviour of a cuckoo's stomach than to organize a nation for war

"Can you not see this little man (Hunter stood 5 ft 5 in in his boots) with his shock of red hair his exuberant vitality, his restless curiosity, making his attack upon the new world of facts probing, measuring, comparing his tools so elementary, and his method, all his own, grappling with Nature, living

should be subjects of consultation between the Voluntary Hospitals Consultative Committees appointed under Section 13 of the Local Government Act and the local Division or Branch of the British Medical Association For the purpose of organizing local medical opinion and of advising local hospital authorities each Branch (or Division) should appoint a Local Hospitals Advisory Medical Committee to which should be referred in the first instance all arrangements and disputes connected with hospital conditions in the area All local arrangements agreed to by the Branch or Division should be reported to the Hospitals Committee of the British Medical Association which acts as the central advisory body

Medical Staffing of Council Hospitals

While local hospital policy depends to a large extent upon local conditions certain general principles such as are contained in the Association's Hospital Policy are applicable to all areas As is well known the Association's ideal local hospital system consists of a series of special and cottage hospitals grouped round a central or base hospital Some of these hospitals will be voluntary hospitals others will be council hospitals The Association believes that the best results will be achieved if the medical staffing of the council hospital is arranged on lines similar to those of the voluntary hospital—that is to say if a part time visiting staff is employed—and it offers the following alternative suggestions for a council hospital staff

I

1 A whole time medical superintendent (resident) in full *administrative control responsible to the local authority* whose duties should be

(*a*) The general administration of the hospital

(*b*) The determination of the admission and discharge of patients

(*c*) The supervision of the work of resident assistant medical officers house physicians and house surgeons

(*d*) In some circumstances the responsible charge of some branches of professional service the demands of which are not incompatible with his administrative duties

2 A whole time resident staff

(*a*) Senior with responsibility for various classes of patients according to the size of the institution

(*b*) Junior with responsibility similar to that of house physicians and house surgeons in the larger voluntary hospitals

3 A part time consultant visiting staff whose duties should be (subject to the administrative control of the medical superintendent)

(*a*) In certain instances to have responsible charge of beds and also to be available for consultant service to all cases in the hospital at the request of the medical superintendent

(*b*) In other instances to be available for consultant services when required by the medical superintendent

4 Clinical assistants appointed from among the practitioners of the area

II

1 A medical superintendent whose duties and responsibilities should be as defined in I (1) above

2 A whole time resident staff with responsibility similar to that of house physicians and house surgeons in the larger voluntary hospitals

3 A part time consultant visiting staff as defined in I (3) above

4 A part time general practitioner visiting staff (subject to the administrative control of the medical superintendent) to have responsible charge of beds and clinics

5 Clinical assistants appointed from among the practitioners of the area

Role of the General Practitioner

The appropriation of Poor Law hospitals by the local authority has in many cases involved the regrading or reorganization of the medical staff The salaries recommended for whole time medical officers in council hospitals are included in the Memorandum of Recommendations approved by the British Medical Association and various associations representing local authorities and this scale has been adopted in the majority of areas The Association has also prepared a schedule of fees recommended for part time work of various kinds at council hospitals In some cases a salary will be arranged on a sessional basis in others a fee will be paid for each case treated The Association attaches very great importance to part time employment in council hospitals and it was gratified to learn from a recent inquiry that local authorities are appointing in increasing numbers part time consultants to council hospitals and are entrusting to them the main specialist work There is also room for a more extensive employment of general practitioners as part of the visiting staff of council hospitals The Association believes that the hospitals the public and the local profession would benefit if general practitioners were given responsible charge of beds under the general administrative control of the medical superintendent Such facilities indeed are almost a necessity in modern social and economic conditions for although a patient may need treatment which is essentially institutional it is often inconvenient or impossible for a general practitioner to treat him satisfactorily in his own home The general practitioner should therefore be able to treat such patients in hospital and the necessary accommodation should be provided either by the reservation of certain beds in general hospitals for the needs of general practitioners or by the creation of home hospitals The general practitioner would of course confine himself to general practitioner cases and would not be permitted to undertake treatment which involved the application of special skill or experience

Private Patients in Council Hospitals

Since the hospital services of local authorities have been extended to provide general hospital accommodation it has been observed that the average social status of patients seeking admission has risen and in a number of areas special arrangements have been made for the reception of private patients Not all the authorities making these arrangements however recognize the payment of the practitioner treating the case, and as it is probable that the custom of providing private wards in council hospitals will extend the local medical profession must be on its guard to prevent the exploitation of its services The question of provision for the medical and surgical treatment of private patients should be considered quite apart from the treatment of patients in the public wards The terms of service of medical officers appointed to council hospital staffs should not extend to private wards and the cost and maintenance charged to private patients should not include any amount in respect of medical services The fee for the medical and surgical treatment of a private patient should be a matter for arrangement between the patient and his medical attendant whether or not the latter is a member of the hospital staff

Questions for Divisions and Branches

Divisions and Branches will find that their most careful attention is required on many other subjects concerned with the development of council hospitals Out patient departments for example, are being developed by some

local authorities in their council hospitals, and the medical profession must do all in its power to prevent the migration to the out-patient departments of patients who ought to be treated by private practitioners The out-patient department should be reserved for treatment which cannot, in the best interests of the patient be obtained elsewhere, either by the usual arrangements between private practitioner and private patient or by contract arrangements Again, the relation of contributory schemes to council hospitals involves the question of payments to visiting medical staffs for the treatment of members of contributory schemes Council hospitals will, in future share with the voluntary hospitals the responsibility for the treatment of these members, and the consequent tendency of schemes to be applied to a whole region rather than to a particular hospital merits the watchfulness of the local profession

Hospital services are passing through a crucial phase of their development, and the present attitude of the medical profession will have a profound effect not only on the practice of the present generation of doctors but on the future of the profession and the nation s medical services Alertness and foresight in dealing with immediate problems will aid progress in the direction of an ideal medical service , indifference may result in the exploitation of the services of the profession and the permanent transfer to local authority services of work which properly belongs to the private practitioner

PUBLIC HEALTH NOTES

MEASLES PROPHYLAXIS

Attempts have been made but without success, to obtain from animals such as the horse, sheep, and goat sera which could be used therapeutically or prophylactically in measles Since 1916 much work has been done on the prophylactic use of serum from convalescent patients It was found that doses of 3 to 5 c cm injected intramuscularly within six days of exposure would, in a very high proportion of cases confer complete immunity for some three weeks The same dose given later would not prevent the attack, but was successful in profoundly modifying it The advantage of this latter procedure was that the child developed a permanent immunity to the disease as contrasted with the child in whom the attack was prevented and who on the passing off of the temporary immunity in a few weeks' time, was left in a susceptible state

Though successful in its use as a prophylactic agent this serum proved to be of insufficient strength to afford any benefit in the treatment of an attack Convalescent serum containing no foreign protein was found not to give rise to any of the manifestations of serum reaction which so commonly follow the injection of sera prepared from animals The early use of serum in this country was limited to children in hospital, much of the work being done at Great Ormond Street Children s Hospital As more satisfactory arrangements were made for the collection of the blood, limited supplies became available for the use of children in their own homes Experiments soon proved that serum obtained from adults who had suffered from an attack of the disease in childhood was potent though in general it was found advisable that the dose in this case should be double the dose found effective when the serum was obtained from one just convalescing from an attack

The report of the medical officer of health and the school medical officer to the London County Council on the measles epidemic 1931 to 1932, published in 1933, summarized existing knowledge

The findings at that time were that convalescent serum was approximately twice as potent volume for volume, as adult serum For prevention convalescent serum was advocated but for attenuation adult serum proved to be hardly less efficacious and being much more readily obtainable was therefore recommended The optimum time for collection of the blood from which the serum would be prepared was between the seventh and the tenth day after defervescence On these findings the London County Council issued instructions for the guidance of those proposing to use serum The securing of complete protection was advised for those contacts (*a*) under three years of age, unless their physical condition was very good and (*b*) all ages who were weakly or debilitated and those who were suffering from any serious intercurrent disease To secure this protection it was suggested that a minimum dose of 10 c cm of serum be given the dosage for those over 3 years of age being reckoned in cubic centimetres by multiplying the age in years by four To ensure protection serum should be administered in the first three days after the earliest known exposure to infection the earlier the injection being made the more likelihood of complete protection ensuing In those over three years of age in whom the physical state was satisfactory it was preferable to aim at a modified attack if circumstances permitted rather than prevention Attenuation might be achieved either by injecting the same dose of serum as that required for prevention but giving it between the fourth and the seventh day after exposure , or by giving within three days of exposure half the preventive dose Serum given after the seventh day is unlikely to effect any modification in the attack It was considered that the immunity which would follow on the attenuated attack would be permanent

1933-4 Epidemic

These findings were not all confirmed in the investigation carried out in the 1933 to 1934 epidemic, of which the following are some of the conclusions, set out by the London County Council medical officer of health

1 Amongst children who were inoculated with adult serum with a view to prevention a protection rate of 78 2 per cent was obtained, compared with 77 9 per cent during the previous epidemic Observations made during the previous epidemic suggested that approximately 25 per cent escaped attack whether injected or not In other words, as the result of serum administration approximately three times as many children escaped attack as would have escaped if serum had not been given Convalescent serum results were inferior to those recorded in the last report, the protection rate being 80 per cent compared with 87 8 per cent The attenuation results were also less successful, the rate being 38 5 per cent against 40 3 per cent in the previous epidemic

2 The superiority of convalescent serum over adult serum was not confirmed by the present study

3 The clinical results suggest that the shorter the "attack-bleeding" interval in respect of donors the more potent the resultant serum is likely to be Serum with an interval under ten years returned a protection rate of 100 per cent, but the number of observations was too small for a decisive test

4 In order to ensure prevention it is desirable to administer serum within six days from the earliest exposure , the differences between inoculation before and after the sixth day are statistically significant, particularly amongst children under the age of 5 years The previous conclusions on the advisability of injecting within three days of contact are not supported by the present findings

5 For the purpose of securing attenuation the desirability of injecting one half the standard dose within six days of exposure rather than the full dose at a later period is strongly emphasized

6 A dose of 10 c cm of adult serum is more successful in procuring protection than half that amount A flat dose of 10 c cm is just as effective as an age adjusted dose 10 c cm is probably too large a dose when attenuation is sought.

her under tribute wrestling with her like Jacob with the angel and saying I will not let thee go except thou bless me Let us imagine him living amongst us—as he does—in the tradition he left behind him, and let us be worthy of him and of it

The Orator was accorded a prolonged tribute of applause, and Mr Mortimer Woolf, Sir Frederick Hobday, Dr Ernest Young, and Dr W S C Copeman spoke to a vote of thanks

SOCIETY OF RADIOGRAPHERS DINNER

The sixteenth annual dinner of the Society of Radiographers, a very pleasant function took place on February 20 at the Holborn Restaurant Miss K C Clark the president of the society acting as hostess The company who numbered more than two hundred included representatives from the Midlands, Lancashire Yorkshire the West of England, and Ireland It was stated that the society had topped the thousand in its membership during the past year which had also seen the formation of two new branches one for Scotland and the other for the South West of England which were represented at the gathering by their respective chairmen Dr J Struthers Fulton and Mr A J Walton The president gracefully welcomed the guests who included Professor J A Crowther president of the British Institute of Radiology Dr L A Rowden past president of that body and of the society Dr G W C Kaye of the National Physical Laboratory and Dr Angus Macrae representing the British Medical Association which said Miss Clark held a watching brief in connexion with the National Register of Medical Auxiliaries and had been very helpful and considerate to the radiographers The radiographic societies of Manchester and district Liverpool the Midlands Scotland and Ulster were represented by their chairman or other officer and some hospitals were represented including King's College and the Woolwich Memorial A message was received from the American Society of X Ray Technicians extending greetings

It was announced that the Archibald Reid memorial medal had been gained this year by Miss M S Milln of the Western Infirmary Glasgow for a noteworthy thesis The first Stanley Melville Memorial medal—the late Dr Stanley Melville was the second president of the society the late Sir Archibald Reid being the first—was presented to Dr J Duncan White the Stanley Melville lecturer for this year The president also paid a tribute to the services of Mr Melville, who has completed ten years as honorary secretary of the society She said that although in the early period it was possible to cope with the work of the society by spare time employment the growth in membership had necessitated different arrangements and Mr Melville had now been made part time secretary

At the eleventh annual meeting of the Open Door Council to be held at the Midland Institute, Birmingham, on Saturday March 6, the first subject for discussion will be the Government's new Factories Bill, now before the House of Commons Members of the general public are invited to the morning and afternoon meetings to hear women's opinions on this and other subjects of national importance The text of the Factories Bill was issued on February 2, it is both a consolidating and a reforming measure, and comprises 152 clauses and four schedules Part VI, dealing with the hours of employment of women and young persons proposes important changes in the law In general the weekly working hours for such employees are not to exceed forty eight nor the daily working hours nine, exclusive of intervals for meals, but any factory may so far as regards women and young persons of 16 and over work overtime up to an aggregate of 100 hours in the year, subject to certain conditions Workers under 16 are not to be allowed to work overtime or to be employed in a factory without a certificate of fitness

WEIGHT LOST BY SWEATING

An interesting exchange of experiences and opinions on the subject of weight lost by miners in hot and deep mines as a result of sweating took place at the annual meeting of the Institution of Mining Engineers Mr A G R WHITEHOUSE of the Mining Research Laboratory, Birmingham University, had confirmed experimentally some previous work showing that with the subject at rest sweating becomes progressively less copious even when water is being drunk, and found in addition that this progressive decrease in the rate of sweating is much less marked when the subject is performing muscular work The sweat glands are apparently liable to partial exhaustion with prolonged sweating although during muscular work the exhaustion is less noticeable As for loss of weight, one of Mr Whitehouse's subjects a medical student showed a loss of weight of very nearly 5 lb an hour Throughout the experiments the subjects had seemed to be more comfortable when working than when at rest, although from the mouth temperature and the pulse rate the reverse would rather be expected Mr Whitehouse suggested that this might to some extent be a psychological matter, because to sit still in an experimental chamber for hours on end is rather depressing From his experiments he said, it seemed that the amount of sweating was not only due to a rise in body temperature, for with the same rise of body temperature as at rest the performance of muscular work considerably facilitated the sweating It seemed probable, therefore that some product of muscular metabolism was responsible for this, though the connexion might be a less direct one

Mining Experiences

Some rather extraordinary figures relating to loss of sweat were quoted by mining engineers in the subsequent discussion One of them stated that the sweat lost by miners in his pit varied from as little as 3 lb a shift up to as much as 10 lb He added that he himself when down in the mine lost 5 lb in three hours, but that he had always got the whole of the weight back after dinner in the evening He was accustomed to drinking copious amounts of weak tea One curious circumstance was that the men lost the greatest amount of weight by sweating after the week end rest The man who lost 10 lb on Monday would lose about 9 lb on Tuesday and progressively less until Friday, when his loss might be only 5 lb, but by the following Monday the heavy figures were again recorded Professor NEVILLE MOSS of Birmingham mentioned that among fourteen men observed in a mine the sweating loss varied from 11 to 18½ lb for a shift of five and a half hours work, and he said that the best workers were those who sweated most profusely He recalled one man from whose skin the perspiration poured off during the whole of the shift and he turned out more coal than anybody else in the pit Another engineer said that he had occasionally done work in a fairly hot pit but with intervals during which he was working under ordinary temperature conditions so that there was no opportunity to become acclimatized and his experience was that during the first day or two in the hot mine he felt uncomfortable and while wanting to sweat did not do so at all profusely Later on profuse sweating took place and the hot mine was then well tolerated It was the experience of another mining engineer that any mine that was strange to him brought about a profuse perspiration suggesting that there was a mental reaction as well as a physical cause but once he was in a pit which was familiar the sweating was in no way marked Finally another engineer told the rather doleful story—without a moral—of a miner who had been one of the best workers in his pit and who usually sweated profusely This man suddenly became a teetotaller whereupon his capacity for work went down tremendously, and eventually he had to give up the pit

necessary level Wash outs are not instituted until the bladder is empty In the few patients into whom an ordinary rubber catheter cannot be introduced a stylet inserted into a rubber catheter of Harris type (Eynard) always overcomes the difficulty

Compare the technique above described with that advised by Mr Irwin—a major operation saved no messy suprapubic box no suprapubic tube with all its acknowledged dangers of sepsis and bladder lavage *not once* but repeated two or three times daily As to the prostatectomy operation itself little need be said Those with any experience of prostatic surgery deplore the haemorrhage and sepsis notoriously associated with the Freyer operation (or "the blind operation,' as Mr Irwin chooses to call it) The haemorrhage may be controlled by packing the prostatic cavity Mr Irwin evidently removes this packing without anaesthesia (or is this the third anaesthesia he recommends?)

The method of prostatectomy advocated by Thomson Walker is an improvement on the Freyer operation—that is a fact generally acknowledged among urologists in spite of Mr Irwin Harris's method (*Brit J Surg* 1934 **21**, 434) is a tremendous advance on any previously known It involves a plastic procedure on the prostate bed and therefore I take it, this must be the plastic operation to which Mr Irwin refers It is not the method for the occasional prostatectomist as considerable experience in bladder surgery is essential and not a little skill It is obvious that Mr Irwin knows little about the Harris method or has been singularly unfortunate in his source of information This is shown when he mentions that in the plastic method (Harris) the bladder neck is sutured round the indwelling catheter ' Harris himself repeatedly condemned this technical error The sutures in the prostate bed are placed and tied and the catheter which is only *then* inserted must be a loose fit in the re formed prostatic urethra That is only one of his misstatements (to call them nothing worse), his whole paper bristles with them

Mr Irwin's post operative treatment seems devised to obviate or minimize sepsis His description of bladder wash-outs through the suprapubic wound and later through the urethra by Janet's method, followed after the ninth day by the daily passage of a catheter per urethram until natural micturition was resumed is illuminating After the plastic operation (Harris) which he so strongly condemns, no irrigation of the bladder is permitted apart from two ounces of fluid occasionally run in through the catheter should there be any obstruction to drainage In spite of such labours as those described by Mr Irwin to eliminate sepsis it persists in 90 per cent of patients after the so called blind operation This I have proved by bacteriological examination of urine taken from patients operated on by various surgeons at varying intervals after operation The most severely infected urines came from these patients on whom a two stage operation had been performed In contrast I have proved that within two months of the Harris operation the urine is usually sterile Has Mr Irwin ever made such an investigation on his patients?

The abdominal wound by the Harris technique is no larger than that described by Mr Irwin, but the Harris wound heals by first intention his obviously does not Does Mr Irwin wish us to believe that a wound in which healing is delayed is less likely to herniate than one healing by first intention? Mr Irwin makes no reference to the average length of time which elapses in his patients between the operation and natural micturition with a permanently healed suprapubic wound After the plastic operation (Harris) the vast majority of patients micturate naturally after the withdrawal of the urethral catheter on the tenth post operative day, and their abdominal wound is by then soundly healed and remains so Further misstatements on the plastic operation (Harris) are that patients so treated suffer from vesical neck pockets in which urine stagnates and obstruction at the vesical neck I have followed up my patients since I first performed a Harris operation in March, 1934 Vesical neck pockets are unknown, and so far as obstruction to micturition is concerned the patients themselves assure me that their urinary stream has the calibre and force they associate with youth

If your readers have not had an opportunity of seeing a plastic operation (Harris) performed by a surgeon experienced in the correct Harris technique and of noting the amazing wellbeing of the patient immediately following the operation and the smooth comfortable, and speedy convalescence, then I ask them to take the earliest opportunity of doing so and meantime I ask them to reserve judgement on Mr Irwin's statements—I am, etc,

Glasgow Feb 12 WALTER W GALBRAITH

Injection Treatment of Hernia

SIR—The letters from Dr E W Archer and Mr Maurice Lee on the above subject which have recently appeared in the *Journal* show that at last we in this country are beginning to realize that operation is not the only cure for hernia My experience of the last seven years in the injection treatment of hernia in selected cases (a most important point) convinces me that it is sound and should have a great future The vast amount of evidence that has appeared in American medical journals in the last few years cannot be lightly thrown aside Whoever reads it must be struck by the fact that all who have investigated and are using the method were sceptical at first but with increasing experience have become convinced of its value There is a clinic at the University of Minnesota for this treatment, and Professor Bratrud tells me that he is impressed with the good results Many who have witnessed Bratrud's work have become enthusiastic supporters of the treatment

The late Dr Ignatz Mayer of Detroit whose technique and solution I use, claimed 98 per cent of cures His cases were, of course, carefully selected He was either (1) a mountebank (2) honest but grievously self deceived or (3) a great pioneer Whichever be the correct answer it is in the public interest to verify or refute his statements My own experience convinces me that his claim is justified What failures I have had can be attributed to (1) faulty selection, (2) faulty technique (3) lack of intelligent co operation on the part of the patient One patient of mine who had a hernia of over ten years history, the size of a foetal head, remains free of all symptoms for over four and a half years

I should be very pleased to give anyone who is interested further details and references to literature—I am etc,

ST GEORGE B DELISLE GRAY F R C S Ed

London W 1 Feb 20

Sedimentometers

SIR—The letters which have appeared as a result of Dr Terence Lee's article in the *Journal* (October 24 1936 p 809) have shown that many of us have independently and almost simultaneously come to the conclusion that the old clinical method of measuring the sedimentation rate is unsatisfactory In the November 1936 issue of *Caduceus* the journal of the Hong Kong University Medical Society we published from this department the details of the method we have been using here for the past year or two

Briefly it consists in setting the blood samples in Wintrobe's tubes and photographing the fall of the corpuscle meniscus

Reports of Societies

RADIO-ACTIVE THERMAL WATERS

At a meeting of the Section of Physical Medicine of the Royal Society of Medicine on February 17, with Dr GEOFFREY HOLMES in the chair, the subject for discussion was the indications for the use of radio active thermal waters in Great Britain

Dr C W BUCKLEY said that some years ago an eminent physician called attention to the fact that all spas claimed to cure rheumatism if the advertisements of bathing establishments were to be taken at their face value, and that the claim of any and every spa to cure rheumatism was straining the credulity of all who knew the disease But inasmuch as Bath and Buxton had attracted rheumatic patients for hundreds of years the waters of these spas might at least be considered to have stood the test of time The action of thermal radio-active waters taken internally was diuretic and affected also the nitrogen metabolism Externally in baths there was evidence that the emanation passed through the skin, but absorption through the lungs was more important Dr John Jones, who was evidently a great spa practitioner in his day, practising probably at Bath in the winter and at Buxton in the summer, described in 1572 the waters of both spas in a way not derogatory to either, and Floyer more than a century later also wrote of Buxton, and both these writers give a list of conditions in which the treatment was indicated The list was not greatly different, allowing for certain changes of words—for example, by "leprosy" they probably meant psoriasis—from what would be given to-day Both these writers placed gout in all forms in the forefront They also included what would now be called fibrositis, rheumatoid and osteo arthritis, delayed convalescence and stiffness remaining after rheumatic fever, gravel, phlebitis, colitis of some kinds, and certain forms of hepatic and digestive disorder, and beyond these, and in common with other systems of warm bathing, local and general, pelvic disorders in women and climacteric disturbances chiefly associated with high blood pressure Some of the skin troubles for which the early physicians said the waters were suited might be dismissed because the washing of the whole body in those days was not very common, and the same results might have been obtained by a thorough bath in ordinary water at home Rheumatoid arthritis was better treated at the radio active thermal spas than elsewhere provided that rest was recognized as an essential part of the treatment and baths were used with the strictest attention to details There was probably a specific effect calling for further investigation, this had been variously attributed to protein shock, auto-inoculation from foci in the joints, and histamine

Clinical Experience

Dr F G THOMSON said that various attempts had been made to explain the therapeutic properties of these waters on the ground of their chemical and physical constitution, and naturally when radio-activity was discovered this was invoked to explain what had been regarded as obscure How far the various factors played a part had not yet been determined in such a manner as would satisfy a panel of scientific experts, but it was not necessary to demonstrate how any therapeutic agent exerted its effects before making a proper use of it It might be said that the use of radio active waters was empirical, and so it was, but so was the use of the greater number of drugs now employed

There were three kinds of conditions which appeared to him as a result of clinical experience to be most suitable for this treatment The first consisted of metabolic disorders—gout, obesity mild glycosuria, early hyperpiesia, and the derangements incidental to the menopause The relief of so called hepatic glycosuria was often very striking In the second place, rheumatic diseases had always been identified with spa treatment The good results were due not only to the specific action of the waters but to the methods commonly employed The deep pool bath with undercurrent douches had always been the most important feature, and this particular type of bath was of more value in chronic rheumatic diseases than any other It was suitable for the majority of rheumatoid and osteo-arthritis cases In cases of rheumatoid arthritis, apart from diminution of pain and stiffness, the general condition showed a remarkable improvement, either from detoxication, improvement in peripheral circulation, or relief of pain, or all combined In the treatment of osteo arthritis not more was to be expected than relief of pain and possibly some arrest of the progress of the condition The third class of cases consisted of diseases of the urinary tract Owing to their powerful diuretic effect radio active thermal waters were of use in catarrhal conditions of the renal pelvis and bladder With regard to sterility in women, it was at one time the custom to send patients to Bath or Buxton in the hope of overcoming this condition but the classic example was not a very happy one to cite The queen of James II went to Bath, and whether owing to the waters or not was in due time delivered of a son This son became the "Old Pretender" and the father of the "Young Pretender," Charles Edward, who caused a vast amount of trouble to this country and to Europe during a good part of the eighteenth century So perhaps the less said about the value of Bath in this respect the better!

Is Radio-activity a Deciding Factor?

Professor SIDNEY RUSS said that spa waters often contained radium or radon, or both, but it was equally true that practically every river and lake also contained these elements The proportions everywhere were minute In a million litres of Bath or Buxton water they amounted to only one or two millicuries, and in the natural gases up to 33 millicuries at Bath If any of the therapeutic effects were due to associated radio-activity it might be expected that the spa waters richest in these elements would be among the most sought, but this was far from the case Sweden had many spas, but the healing property of these spas could scarcely be connected with their radio activity because the drinking-water of Stockholm from the artesian borings in the granite was far more radio-active than the water of any one of the spas He went on to describe the work by Dr F D Howitt, Dr E C Pillman Williams, and himself, recorded in the *British Medical Journal* of January 30 (p 208), on the physiological effects produced on patients by ordinary tap water containing measured quantities of radon These workers had been forced to the conclusion that in cases of rheumatism no demonstrable change was found in the clinical condition through such treatment Doses were used of radio active gas in ordinary tap water ranging from one thousand to one million times as great as was found in the average radio-active spa water When the great benefits which patients derived at spas were considered, due no doubt to the medical advice they obtained and the regime they followed in taking waters containing a considerable variety of chemical compounds which might reasonably be held to have some action on the body processes it seemed a pity to drag in radio-activity Medical men, especially those in charge of important spas would be doing a service if they rejected a claim which led to exploitation by non-medical persons

Dr FRANK HOWITT said that it did not require a great knowledge of physiology to understand that the ingestion of small amounts of minerals and chemicals could alter the metabolism of the body A slight swing over of the *p*H to the alkaline side might perhaps effect a good deal, and it was possible that spa waters contained the exact amount required to treat the fundamental disturbances of chronic rheumatism He went on to give further details of the investigation into the action of radon introduced into ordinary tap-water He had been able to find no clinical

every six minutes, using a Leica camera The film is developed and the readings read off from the negative by means of a lens or a dissecting microscope The scientific advantage is that on the same sample the volume of packed red and white cells, mean corpuscular volume, and mean corpuscular haemoglobin concentration can all be measured The technical value of the method lies in the fact that a large number of samples (in our apparatus twelve) can be investigated at the same time, and this should commend itself to laboratory workers dealing with large numbers of blood samples

In the August issue of the same journal I discussed three other constants—namely, aggregation time, sedimentation time, and aggregate sedimentation rate—which are measured by this method, and I should be only too pleased to send reprints of these articles to anyone interested, and more than pleased to receive their criticisms of the arguments therein —I am, etc,

LINDSAY RIDT
The University, Hong Kong, Feb 4 Professor of Physiology

Prevention of Silicosis

SIR,—It was with great interest that I read the letter of Drs A E Barclay and Richard Fawcitt, and their tentative conclusion "that there must be at work some predisposing factor or factors which influence the incidence of silicosis" It is certain that many will look forward to the publishing of their findings supporting the hypothesis that dust diseases are (*a*) secondary to a probably infective primary condition, and (*b*) that this operates by impairment of the normal excretory action of the cilia

Just as a puncture may result whether the pin be forced into the finger *or* the finger on to the stationary pin, so, as Dr Goodfellow contends, *a priori* the lung tissues might be punctured by their surging movement over the sharp particles, although such sharp siliceous particles had themselves lost all momentum It is certainly difficult to grasp and on statistical grounds would seem "against nature" that the most widely distributed of chemical elements and a very inert one, should be poisonous to man even if introduced through the respiratory tract On the contrary, it seems natural to associate with poisons great potential activity allied with rarity of distribution And it must not be overlooked that even if silicosis were due to poisoning by silica, and not rather by bacteria introduced by silica to tissues predisposed, as suggested by Drs Barclay and Fawcitt, the tuberculosis which often ensues is incontrovertibly due to the introduction of bacteria If silica is even then still being added, then the silica particles will presumably play some part in introducing the tubercle bacillus—so why not initially?

It might even be that silicosis itself is a threshold form of tuberculosis—never otherwise met with—due to the possible modifying action of the silica particles on the tubercle bacillus, which they themselves are introducing That is to say, that whilst the silica particles introduce the tubercle bacillus they slow down its progression and in many cases prevent its full course into the commonly recognized tuberculosis, finishing instead with a specific type of "tuberculosis" recognized as silicosis May I also make the following suggestion

Both silica and carbon are powerful adsorbents, but carbon is the more powerful of the two Carbon also is much less hard than silica, and its particles will be relatively blunt, less irritating, and much less liable to puncture than those of silica The mechanism of the reception of silicosis may therefore be as follows Silica particles before inhalation may adsorb from the air, where they are known to circulate, bacteria and other micro organisms If the tissues in the lungs are even slightly punctured or scratched by their relative movement with regard to the silica particles, however set up, such bacteria, etc, may be readily introduced But the inhibiting effect set up by the simultaneous presence of coal particles—which was so strongly insisted on by the late Professor J S Haldane—might occur as a result of selective or rearranged adsorption by the stronger adsorbent—that is, carbon—of the bacteria first adsorbed by the silica particles, from the silica particles themselves That is, on introducing coal particles the venue of the bacteria might be changed from its original site around the sharp cutting edges of the silica particles, ideally positioned for introduction into small wounds, to the non cutting surfaces of the coal particles ideally positioned for non introduction into the small wounds by being retained at maximum distance from them In this case the possible slowing down of tuberculosis into silicosis by silica particles may be still further slowed until even silicosis were practically prevented The result would be that, though the lungs were maximally clogged with mixed dusts, their destruction would be prevented, as contrasted with lungs less clogged with silica dust alone Whether or not this is correct, it seems *a priori* much more likely that the cause of silicosis is mechanistic, physico chemical (adsorptive), and bacterial than due to organic poisoning by the earth's most common element For in the former case the various processes are known to exist and to be effective in certain ways, whilst in the latter the effects observed seem not even to be justified by expectation, and are, as it were, outside the "universe of discourse" —I am, etc,

Leeds Feb 9 S C BLACKTIN

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR,—I was much interested in Mr R R M Porter's letter in your issue of February 6 (p 301) on the subject of rupture of a Graafian follicle simulating appendicitis, as I have had a similar experience in the last few weeks with a member of my own household

She had been complaining during the night of right sided abdominal pain, and had vomited When I saw her in the morning there was obvious tenderness and rigidity over the appendix region, and the temperature was 99 8° F On the strength of these symptoms I sent her into hospital with a diagnosis of appendicitis At operation the appendix was quite healthy, and the only thing found to account for her symptoms was a recently ruptured Graafian follicle which had escaped into the peritoneal cavity In this case the rupture in the ovary was no longer bleeding, so there was no occasion to remove the ovary

I had never heard of such an accident giving rise to symptoms of this kind before, and have been left wondering how common the association may be One certainly would not think the accident itself can be a very rare one —I am, etc,

Portsmouth, Feb 16 E W DEWEY

An Oxygen Tent Service

SIR,—I read with much interest the letter on the oxygen tent service from Drs Hilton, Pearson, and Poulton (February 20, p 413) There are two points I would like to raise The flowmeter supplied with the original tents issued was of the "dry" type and its accuracy appears to be easily upset As a result low oxygen concentration readings are obtained and the tent is quite wrongfully blamed I have had experience of two other flowmeters

advantage in any of the rheumatic conditions, endocrine disturbances, or other disorders which were mentioned in literature from time to time as being benefited by this agent When testing the effect of doses far in excess of those of spa water certain alterations were found, some good some bad, an alteration, for example in uric acid metabolism, and on the other side of the balance sheet a damage to the erythrocytes If the spa physicians could adduce laboratory evidence in explanation of the results which it was known they had obtained it would be of great value

The Bath Reaction

Dr GEOFFREY HOLMES said that in 1912 he began his balneological experience at a hydro where only tap water was used, and he was frankly surprised at the results obtained by the internal and external use of plain tap water without any drug treatment whatever Later he took up an appointment as house physician at the Devonshire Hospital Buxton and one day, after swimming about for twenty minutes in the large pool bath he felt the most unaccountable drowsiness, which he afterwards learnt was the bath reaction It convinced him that there was something in the effect of that particular bath different from any water he had been immersed in before Undoubtedly there was a difference in spa water, and perhaps some spa practitioners being at a loss to explain the difference had hailed the discovery of radio activity as a godsend

Dr J B BURT said that the easiest way to induce a sarcastic smile on the part of a London physician was to mention radio activity in spa water There were two schools of thought with regard to spa treatment People in America England and Holland said that spa treatment was simply cleverly applied ordinary hydrology (tap water) On the other hand, the physicians of France Germany, Austria and Italy looked aghast if it were suggested to them that tap water and spring water had the same action In these latter countries there were a large number of spas and the experience of their practitioners must be greater than that of the average London physician He had welcomed the paper by Professor Russ and his colleagues in the *British Medical Journal* because it had cleared away a certain amount of rubbish' talked about spa treatment As far as the emanation was concerned he thought it extremely doubtful whether, except in gout, there was any effect, but it was only fair to point out that spa water in a typically radio active spa like Buxton or Bath was in quite a different category Radium emanation he thought gave only the alpha rays, but at these spas all the breakdown products from uranium to lead were found Not only alpha but the extremely powerful beta rays were given off, and altogether the conditions were entirely different from those of experiments in which tap water was impregnated with radon Professor RUSS explained that if radon was in water there was essentially the same radiation as with radium—not only alpha rays but beta and gamma rays

A Question Still Obscure

Dr LEONARD WILLIAMS said he had come to the meeting to listen to something new, and had not heard it It seemed to him that it was not possible to talk about spa treatment as if it were only a question of climate or douches It was a composite effect of all these factors which produced the results He knew nothing about radium but he did know something about Bad Gastein, where there was an element in the waters which could not be accounted for by their chemical composition That was insisted upon a great many years ago by von Liebig, who investigated these waters, he found that there was a *tertium quid* which could not be explained by any chemical process—whether it was radium he did not know, but it did at any rate offer some explanation of the hitherto inexplicable The radium might be of the nature of a catalyst After all, what went on in Nature's laboratory was very different from what went on in the laboratories of Middlesex Hospital

Dr L C HILL mentioned that some years ago he spent a 'very miserable month in going through the literature mostly Continental, recording the experiments carried out in this field He found nothing but rubbish, deductions not worth the paper they were written on save for one experiment, which seemed worth quoting At Wildbad some twenty or thirty cases of fibrositis were being treated in the late autumn when a change of weather occurred, with freezing of the pipes conveying the spa water to the bathing establishment The establishment thereupon turned over to the town water The patients, about 70 per cent of whom had been showing the bath reaction immediately showed it no longer and all made remarks indicating that they felt a distinct difference—an improvement, in their view, because they lost the feeling of lassitude and tiredness when taking the baths A week later, when the spa water could again be used, the bath reactions reappeared as usual Dr A R NELIGAN argued that as radium in large amounts was manifestly able to produce striking effects, it was logical to assume that even the minute quantities in thermal springs were not without some favourable action

UTERINE PROLAPSE

At a meeting of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine on February 19, with Mr CLIFFORD WHITE in the chair, the operation for prolapse was the subject of two communications followed by a discussion

Modified Gray-Ward Operation

Mr EVERARD WILLIAMS, with the aid of a series of excellent photographs described a modification of the Gray Ward operation for complete procidentia He reminded the Section that the principle of the Mayo technique for the cure of cystocele accompanied by prolapse was the same as in the interposition operation The uterus was removed and the broad ligaments were sutured together, interposed under the bladder, and anchored to the vagina in the same way In the experience of Gray Ward the weak point in the operation was that an otherwise perfect result might be impaired by the subsequent development of enterocele or high rectocele This was due to the extensive stretching of the posterior segment of the pelvic fascial supports which was usually found in complete procidentia The Gray Ward technique consisted in addition of the removal of the pouch of Douglas and the shortening and approximation of the utero sacral ligaments In the modification described by Mr Williams still further attention was paid to the dissection of the posterior segment and the definition of the layers of fascia This was accomplished by the inclusion of the necessary posterior colpo perineorrhaphy in one step with the hysterectomy and the complete reversal of the order of procedure The dissection began from behind at the posterior commissure of the vagina and not from the front below the urethra as in the technique followed by Gray Ward Mr Williams described a small series of cases operated on over the last five years

The Transposition Operation

Mr J ST GEORGE WILSON showed a film in natural colour photography of the transposition (interposition) operation He said that the nomenclature was somewhat indefinite The name interposition was first suggested by Wertheim and later transposition was proposed Most writers in America associated it with the name of Watkins and European writers with the name of Wertheim He gave a brief history of the operation bringing the story down to a paper by Everett in 1935 recording 117 cases operated in the Johns Hopkins Hospital, with four recurrences the author comparing it

one designed by Dr Poulton (to be published shortly), and the other marketed by the British Oxygen Co , both these are of the water depression type and appear to be more accurate I suggest that wherever a tent is in constant use one of these flowmeters is kept to check the accuracy of the model fitted to the tent for this purpose the inlet tube on the injector is stopped down with a cork and the outlet tube connected with the flowmeter

The other point which I think of great importance is in the matter of running the tent The service mentioned in the letter published on February 20 applies to small hospitals and other places which own no tent of their own , but it is essential that those hospitals which own a tent should ensure that they have easily available a member of their staff acquainted with the working of the tent If this is not done the tent will be wrongly assembled and will be blamed for the poor therapeutic result —I am, etc

Beckenham Feb 20 D C REAVELL, M D

Obituary

Dr WILLIAM BRAMLEY TAYLOR who died at Weybridge on February 12, aged 90, was for many years a prosperous and widely respected practitioner in Denmark Hill He was apprenticed to his father Charles Taylor at Apothecaries Hall studied at Guy s, and was made free of the Society of Apothecaries in 1868 In 1869 he obtained the L S A and in 1870 became M R C S thus holding the double qualification for general practice customary before the establishment of the Conjoint Board He served for a while as assistant medical officer at Camberwell House and then turned to private practice His public spirit was shown by his work for the Royal South London Dispensary and was recognized by his appointment as a justice of the peace for the County of London Apart from his professional work his interests were social and literary His father was an old loyal member of the Society of Apothecaries and was Master in 1890 Bramley Taylor followed in his father s footsteps In 1886 he joined the Friendly Medical Society—a dining club which was founded in 1723 to promote friendship between apothecaries who in those early days had abandoned trade and confined their activities to medical practice Taylor continued to attend the meetings regularly until he was elected to the Court of Assistants in 1905 Thereafter so long as he was able he gave all his energy and enthusiasm toward furthering the interests of the Society of Apothecaries In 1910 he became librarian, and with great industry arranged the books and compiled a card index In 1913 he published a catalogue of the books then possessed by the Society In 1912 he was elected Master after his year of office he continued his work in the library until 1930 when owing to failing sight, he was compelled to resign Shortly afterwards he retired from the Court of Assistants His courtly manner his enthusiasm, and his surprising energy will live long in the memory of the Society of which he was a member for so many years

Dr RUSTOM NUSSERWANJI COORLAWALA who died in Hyderabad last November at the age of 56, was well known for his work in surgery and radiology Born at Satara in 1880, he was educated at the Hyderabad Medical School and in Edinburgh London, and Paris In 1904 he qualified L R C P L R C S Ed , and L R F P S Glas and in the next year took the Cambridge D P H and the L M at the Coombe Hospital, Dublin He obtained the diplomas M R C S Eng L R C P Lond in 1907 and the F R C S Eng in 1909 He was also L M S Hyderabad He held at first clinical appointments in London hospitals and in 1911 began his service under the Nizam s Government as house surgeon in the Afzulgunj Hospital From 1912 to 1933 he held professorial rank, first in ophthalmology and then in anatomy and surgery, in the Osmania Medical College In 1922 he was appointed first surgeon at the Osmania Hospital, and was its acting superintendent from 1922 to 1929 During this time the new hospital was completed and opened under his active direction Until February 1936 when he was placed on the retired list he was Household Physician to the Nizam and his family , in 1933 he accompanied Prince Huazzam Jah Bahadur on his tour in Europe and subsequently received the title of Nawab In 1935 he again travelled with the Prince in Europe Dr Coorlawala s chief interest lay in surgery, and the radiological advances in this respect made a special appeal to him He contributed to the *Proceedings of the Hyderabad Medical Association* and the *Deccan Medical Journal* In 1920 he was elected a member of the British Medical Association

The late Dr JOHN WILLIAM ROWLANDS, J P received his medical education at the Glasgow Royal Infirmary, and in 1879 obtained the diplomas L R C P Ed and L M and L R F P S Glas and L M After holding the appointment of house physician in the Glasgow Royal Infirmary he engaged in general practice in Llanaelhaiarn, Llanwnda Glamorganshire where he attained wide popularity and was greatly esteemed for his clinical ability and his invariable kindness and sympathy for all in distress He took great interest in the development and social progress of the neighbourhood , for some years he served as a county councillor, and was a justice of the peace Dr Rowlands joined the British Medical Association in 1882 He was chairman of the South Caernarvon and Merioneth Division in 1909–10, and a representative in the Representative Body at the Annual Meeting of the Association at Belfast in 1909 He died at his residence in Llanaelhaiarn, where he had been in general practice for over fifty years, and had been medical officer and public vaccinator His son, Dr John L Rowlands practices at Llanaelhaiarn

The death has occurred in London of Dr LEONARD GREENHAM STAR MOLLOY who was Conservative M P for Blackpool in 1922–3 He was born at Nass Co Kildare, in 1861 and studied medicine in Dublin graduating M D of Trinity College in 1889 From 1891 to 1923 he practised at Blackpool and thereafter in Monte Carlo and Harley Street During the war he served in France and Belgium with the rank of major in the Duke of Lancaster s Own Yeomanry and was twice mentioned in dispatches and was awarded the D S O Dr Molloy was honorary consulting physician to the Victoria Hospital, Blackpool to Rossall School and to a number of charitable institutions He was an honorary life member of the St John Ambulance Association and a Knight of Grace of the Order of St John of Jerusalem He joined the British Medical Association soon after graduation but resigned in 1913 during the early days of the National Insurance Act

Dr NOEL CHARLES BEAUMONT who had been district medical officer for Stainland near Halifax for over a quarter of a century died from pneumonia on February 21 at his home Stannary House Stainland aged 63 years He studied medicine at St Bartholomew s Hospital obtaining the M R C S and L R C P diplomas in 1901 He then served as junior and senior house surgeon and anaesthetist at the Royal Portsmouth Hospital and was for some time chief Government medical officer at Port Moresby Papua After settling down in practice at Stainland in 1909 Dr Beaumont was appointed medical officer and public vaccinator for the district He joined the British Medical Association in 1911 the year in which he married

favourably with treatment by vaginal hysterectomy and colporrhaphy The indications for the operation were a large cystocele with a large prolapsed uterus in a woman past the menopause The operative technique was practically the same as described in Professor Blair-Bell's *Principles of Gynaecology* In the majority of cases the posterior vaginal wall was repaired together with the introduction of mattress sutures in the perineum

The advantages of the operation in cases of large anterior vaginal prolapse were that it gave greater support to the bladder and anterior part of the pelvic floor than could be afforded by an anterior colporrhaphy It was mechanically impossible for the bladder to sag down again, so that the recurrence of anterior vaginal prolapse was extremely unlikely In frail, debilitated women, whom it was dangerous to keep so long in bed after an anaesthetic, transposition could be done by itself and the women be out of bed within a week without unsatisfactory results The disadvantages of the operation were that the peritoneum was opened, with slight added risk—the only death in his series had been due to septic peritonitis—and that the operation could only be done safely after the menopause If done before the menopause great care must be taken to remove the Fallopian tubes or otherwise sterilize the patient Again in the event of the necessity of hysterectomy later on the operation was made more difficult He had carried out the operation fifty-two times with, as stated one operation death Of the thirty-five replies received to an inquiry among patients on whom the operation had been done for a longer period than six months twenty-nine testified to functional cure Three had symptoms—two of dyspareunia and one of backache, one of the patients with dyspareunia had stenosis and the one with backache had enterocele

General Discussion

Mr R H Paramore speaking with regard to Mr Williams's communication said that in all cases of marked prolapse it was very necessary to get rid of the redundancies of the vaginal wall, which could easily insinuate themselves into the aperture He did not believe anyone would succeed in this operation unless the pelvic floor musculature was in an efficient functional state During the period 1922–31 he had performed the interposition operation forty-four times, and though he had not sent round an inquiry as to the after-results, he was under the impression that the operation was followed in the great majority of cases by success It was specially an operation for women past the child-bearing period

Professor James Young considered it very important to recognize that no reconstruction directed to the repair of prolapse could possibly succeed unless it had as its underlying basis the recognition of the importance of the muscle With regard to rival types of operation he considered that no one type availed for all cases Those who had studied the results of the Donald-Fothergill procedure would probably feel that with that operation there was as high an incidence of success as was to be expected of any

Mr V B Green-Armytage congratulated Mr Everard Williams on his courage on coming 'amongst the Fothergillians' He considered it a very important thing to separate the base of the bladder completely, otherwise there was a tendency to stretch the trigone of the bladder, with unfortunate results He also noted Mr Williams's reference to the utero-vesical fold If this fold were sutured too far back on the uterus the floor of the bladder was below the level of the trigone with the same result as in a prostate case—residual urine and stone Great care should also be taken where the surgeon put the fixation suture which went from the vagina through the uterus If it was put through the uterus too low down the uterus tended to become acutely anteflexed, if too high up it tended to bulge and the patient came back with dysuria The uterus in some of these patients was long, and if the suture was put through the fundus it was likely that the patient would return with some form of dysuria or frequency The lower suture should go through at the angle of junction of the cervix with the body of the uterus Finally he pleaded that a self-retaining catheter be put in for forty-eight hours until the patient regained control

Professor J M Munro Kerr said that the interposition operation was ideal in cases of elderly women with cystocele, just as the operation which Mr Everard Williams had described was ideal in certain cases of prolapse of the posterior vaginal wall He had had the pleasure of seeing Mr Williams carry out this operation a day or two previously and had been very much impressed with his technique He had tried the Mayo operation in a few cases and the Gray-Ward operation in a few, but for certain cases—he would not say all—the technique advised by Mr Williams was a distinct advance The special point in his technique was that the utero-sacral ligaments were approached from below, giving he thought, a much better hold than would be afforded by working from above downwards He begged gynaecologists not to put one operation against another, but to select the operation for the particular case

Dr J P Hedley said that rectocele practically never occurred after the Fothergill operation Enterocele was a different thing altogether These operations of tightening up the ligaments were all very well but he had dem them from above with no success at all Mr Learoyd Walker related his experience with a patient who had become pregnant after an interposition operation in Vienna The patient went to term, and he carried out a Cæsarean section Although the case gave rise to a good deal of anxiety it turned out well The incision was somewhere well down the back of the uterus, and the opening of the internal os about three quarters up the posterior wall of the gestation sac

Mr Everard Williams replied that he was not contending that his operation should be done to the exclusion of any other He dissociated himself from the Manchester school who could "see 2,000 cases of prolapse and do 2,000 Fothergill operations No operation was completely successful in hundreds of cases Mr St Gross-Wilson said that formerly in America the interposition operation had been done on women of all ages but he thought it was now carried out only after the menopause or at least the patient was sterilized It was not a good operation before the menopause In the event of enlargement of the body of the uterus he imagined that it would mean a struggle to get it out and he recalled the bitter comments of a gynaecological surgeon in such a case on people who did interpositions With regard to the perineal body, he thought this a very much overrated structure from the point of view of the support of the uterus He was also against the self-retaining catheter It would be better to carry out repeated catheterization

Self-administration of Nitrous Oxide in Labour

Mr Chassar Moir exhibited a new type of apparatus for the self-administration of nitrous oxide gas during labour The machine differed from the automatic machines previously introduced by supplying full strength gas Labour pains were intermittent and the patient was not to be expected to go on inhaling a gas-air mixture during intervals between the pains The success of analgesia was determined by the amount of gas the patient could receive in a very short time Experiment had shown that if pure gas were inhaled for twelve seconds—that is over two deep breaths—the effect was considerably greater than with the usual method of using diluted gas over a longer period Safety was ensured by limiting the absolute amount the patient could inhale at one time This was done by means of a reservoir containing only enough gas for two deep inhalations, and then refilling very slowly, taking a minute to do so The number of patients so far observed with these machines was 120 Cyanosis, usually quite slight, had been seen in only five cases, and there had been no harm to mother or foetus

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

Among the graces approved at a congregation held on February 20 was one abolishing the thesis for the completion of the M B degree, in accordance with recommendations made by the Faculty Board of Medicine (see *British Medical Journal*, February 6, 1937, p 278)

The following medical degrees were conferred on February 20

M B B CHIR—W L Petter, E B McDowall, J F Goodall, G S Steele Perkins, C Hardwick
M B—E L Pochin W F Richards
B CHIR—G O Brooks

UNIVERSITY OF LONDON

At a meeting of the Senate held on February 17, with the Vice Chancellor Mr H L Eason in the chair, Professor F A P Aveling D Sc., Ph D, was appointed a Fellow of King's College and Professor Raymond Pearl, LL D, Sc D, Ph D, was appointed Heath Clark Lecturer for 1937

UNIVERSITY OF BIRMINGHAM

Dr H P Newsholme medical officer of health to the city of Birmingham, has been appointed professor of hygiene and public health in the University in place of the late Sir John Robertson

UNIVERSITY OF LEEDS

At its meeting on February 18 the University Council appointed Dr R E Tunbridge at present medical tutor and registrar, to the new post of Reader in Medicine and Mr A J C Latchmore as second surgical tutor

UNIVERSITY OF GLASGOW

The Secretary of State for Scotland announces that the Regius Chair of Materia Medica in the University of Glasgow is vacant owing to the resignation of Professor Ralph Stockman and that it is proposed to take steps to fill the vacancy The professor will in future retire at the end of the academical year in which he attains the age of 65 Applications for the chair accompanied by two copies of recent testimonials should reach the private secretary Scottish Office Whitehall London S W 1 not later than March 31 Particulars of duties, salary, etc, may be obtained from the same address

The Services

LANGLEY MEMORIAL PRIZE

The Langley Memorial Prize value £21, is open to competition among officers of the Colonial Medical Service who are serving or who have served, in West Africa

The prize will be awarded for the best paper submitted on a topic falling within one of the following subjects (special consideration being given to original work) (*a*) tropical medicine or surgery, (*b*) tropical hygiene and sanitation, (*c*) tropical entomology and parasitology

Papers, which may consist of either published or unpublished work must be delivered to the Secretary, London School of Hygiene and Tropical Medicine, Keppel Street, Gower Street W C 1, on or before October 1, 1937

DEATHS IN THE SERVICES

Inspector General JAMES HAMILTON MARTIN, D S O, R N (ret) died at Ealing on February 14 at the great age of 95 He was born at Truro on August 8, 1841, the son of Hamilton Duckworth Martin was educated at Truro Grammar School and at University College, London and took the M R C S and L S A in 1864 Entering the Navy soon after qualifying he became inspector general on January 1, 1900, and retired on January 1, 1902 He had a long record of war service He was surgeon of H M S *Nassau* during encounters with Sulu pirates, and was present at the destruction of Chrang in 1872, staff surgeon in charge of transports during the Zulu War 1879 mentioned in dispatches (medal and clasp), staff surgeon of H M S *Thalia* during the Egyptian War of 1882 was senior medical officer in charge of transports and received the thanks of the Admiralty (Egyptian medal and Khedive's bronze star), principal medical officer to the Royal Marine Battalion in Eastern Sudan in 1884, present at the battles of El Teb and Tamai, wounded, mentioned in dispatches and specially promoted to fleet surgeon (two clasps), fleet surgeon of H M S *Boadicea* the flagship, and served as principal medical officer of the Naval Brigade landed under the command of Vice Admiral the Hon Sir E R Fremantle, K C B commander-in chief of the East India Station for the punitive expedition against the Sultan of Vitu East Africa, in October, 1890, mentioned in dispatches (general Africa medal with clasp and D S O) He had received a Greenwich Hospital pension

Major CHARLES EDWARD GREY STALKARTT R A M C (ret) died at Bury Hall, Alverstoke, Hants, on February 18 aged 71 He was born on August 31, 1865, the son of the late John Stalkartt of Chopra Bihar, and was educated at Edinburgh University where he graduated M B C M in 1886 and M D in 1890 also taking the M R C S and L R C P Lond in 1889 While at Edinburgh he filled the post of prosector in the University dissecting rooms Entering the Army as surgeon on July 28, 1891 after a period in general practice he became major after twelve years' service and retired on July 28 1911 He served in the South African War in 1900 taking part in operations in the Orange Free State including the actions of Paardeberg and Karee Siding, receiving the Queen's medal with two clasps In September 1900, he was invalided home in consequence of enteric fever When the war of 1914-18 began he was recalled from the Reserve of Officers and served as officer in charge of the base depot of medical stores in France, finally relinquishing duty in October 1919

Major JOHN MILO RYAN R A M C died at Lahore on December 4 1936, aged 44 He was born on June 7 1892, and was educated at Trinity College, Dublin where he graduated M B B Ch and B A O in 1915 He took a temporary commission as lieutenant in the R A M C on November 8 1915, became temporary captain after 2 years service and took a permanent commission as captain on July 1, 1919, becoming major on November 8, 1927 He served in the war of 1914-18 He had been a member of the British Medical Association since 1925

Medical Notes in Parliament

In the House of Lords on February 22 Viscount Ghee presented a Bill to amend the description of the persons with whom arrangements may be made under the National Health Insurance Act, 1936, for the dispensing of medicines, and it was read a first time

In the House of Lords on February 23 the Regency Bill was read the third time and passed

The Coal Mines (Employment of Boys) Bill was reported to the House of Commons from a Standing Committee on February 17

The Geneva Convention Bill, which has already passed the House of Lords, was reported from a Standing Committee of the House of Commons without amendment on February 18

The report of the Select Committee on Medicine Stamp Duties was presented to the House of Commons, with minutes of evidence, on February 18

In the House of Lords on February 19 the Royal Assent was given to the Firearms Act, the Unemployment Assistance (Temporary Provisions Amendment) Act and to other Acts

In the House of Commons on February 23 Mr D Grenfell moved a resolution viewing with concern the conditions revealed by the inquiry into the Gresford colliery explosion, in which 265 lives were lost, and expressing the opinion that grave responsibility rested on the country and Parliament to prevent such disasters by adopting immediate and effective measures for ensuring

Dr R J MINNITT expressed some scepticism as to whether the required analgesia could be obtained in two breaths Mr D H MACLEOD asked whether the analgesia was sufficient for the delivery of the head Professor JAMES YOUNG said that he had found the method give more perfect analgesia than any other of the kind Mr MOIR replied that patients in labour were apprehensive and perhaps not in full control of respiratory function, but if the reservoir could not be emptied in two deep breaths it certainly could in three He did not think the machine could be depended on until the end of labour, though a few patients had continued to clutch the apparatus and had been delivered quite successfully under the influence of the gas

Ocular Changes in Pregnancy

Dr GRACE JONES read a short communication on the ocular changes in normal and hypertensive pregnancy It was based on an investigation of the retinal condition in 500 normal and 144 hypertensive cases Of the hypertensive cases ninety had been re examined five months to two years after delivery The higher the blood pressure and the longer the duration of toxaemia the greater was the amount of retinal involvement The subjective signs, on the whole, were few The most common symptom was the seeing of spots and flashes of light also dimness of vision, distortion of images occasionally discomfort and rarely pain The ocular picture included changes in the disk, retina, and vessels Swelling of the disk was the first change to be noted in the majority of cases, the swelling being due largely to oedema The whole fundus tended to have a steamy or hazy appearance The 144 cases of hypertensive pregnancy had been subdivided into three groups for the purpose of the investigation—namely, cases of moderate and of severe hypertension, and cases of eclampsia Four arbitrary grades of retinal involvement were marked mild oedema of the disk of the retina, marked oedema, small cotton-wool patches of exudate and haemorrhagic areas in the retina, and diffuse retinitis of the albuminuric type

In cases under medical care retinitis should never be allowed to develop, and the first sign of exudate or haemorrhage was an indication for immediate induction of labour To prevent retinal involvement and subsequent nephritis all cases of toxic pregnancy should be induced after symptoms had persisted for fourteen days Of the ninety cases re examined 21 per cent showed residual chronic nephritis or chronic hypertension Of these one in seven with normal fundi or with early retinal involvement showed residual lesions and four out of five of those with advanced retinitis The prognosis as regards vision in cases with retinitis was reasonably good

HAEMORRHAGIC DIATHESIS

A symposium on the 'haemorrhagic diathesis" was held at a meeting of the Manchester Medical Society on February 3

Dr J F WARD said that although the term 'haemorrhagic diathesis usually signified the group of purpuras it was also applied to other conditions in which repeated haemorrhages occurred from capillaries, either spontaneously or as the result of minimal trauma, and included the haemorrhagic disease of the newborn and haemophilia These various conditions differed in respect of hereditary influences, the most frequent site of haemorrhage, coagulation and bleeding time and the number of platelets in the circulation Varying figures given for the coagulation time by different workers were due chiefly to the lack of a uniform and satisfactory method of estimation Haemorrhagic disease of the newborn was a deficiency disease as it was satisfactorily treated by injections of whole blood, but the missing factor was not known In scurvy the haemorrhagic tendency was clearly due to lack of vitamin C It was doubtful if true haemophilia ever occurred in the female sex, although cases were reported in which it seemed possible Foulis and Crawford's case was difficult of explanation unless it were due to marriage of a haemophiliac with a female 'carrier Pseudo haemophilia differed from true haemophilia and some of the reported cases were probably examples of inherited purpura No treatment was known that would cure haemophilia, temporary arrest of haemorrhage was more satisfactorily obtained by blood transfusions and in the case of external haemorrhage application of the venom of Russell's viper, which shortened the coagulation time and would be used in high dilution without diminishing its potency Timperley and Naish's treatment with egg white or mucic acid was on trial and had given promising results in their cases

Primary and Secondary Purpuras

Dr JOHN F WILKINSON discussed the non familial haemorrhagic states or purpuras After considering the main features of these and classifying them into primary (idiopathic) and secondary purpuras he dealt in detail with the primary purpuras represented by Werlhof's purpura haemorrhagica and by the Henoch Schonlein purpuric syndrome The features of purpura haemorrhagica were the occurrence of haemorrhages or purpura in or from the skin or mucous membranes, with a reduction in platelets, prolonged bleeding time normal coagulation time and non retractile blood clot The initial manifestation might be epistaxis haematuria, haematemesis melaena, or intracranial haemorrhage, and case records were cited to illustrate this Spontaneous remissions were common, and there was a tendency to seasonal onset of symptoms Dr Wilkinson then described the blood changes in this group of purpuras and indicated their importance in association with the clinical findings in making a diagnosis and deciding upon the correct lines of treatment The various forms of treatment were assessed and the value of splenectomy in association with blood transfusion was demonstrated with the aid of case records The indications and contraindications for splenectomy and the need for choosing the right moment for operation were then considered

As distinct from these purpuras the group represented by the Henoch Schonlein syndrome was less constant The condition appeared to lie between the urticarias and the purpuras As a rule the blood findings were normal It was clear that Henoch's purpura and Schonlein's purpura were not distinct entities but merely varieties of the same syndrome Purpura was not the predominating symptom The condition was usually seen in girls and lasted throughout life with remissions and relapses but the symptoms might change in any individual at different times the main ones being pyrexia, pains in the joints gastro intestinal symptoms (nausea vomiting colic diarrhoea, blood and mucus in the stools) angioneurotic oedema and so on Treatment was unsatisfactory

Dr Wilkinson concluded with a discussion of the importance of vitamin C in relation to the purpuras In the subsequent discussion Dr WILLIAM BROCKBANK referred to two cases of purpura haemorrhagica that had responded to splenectomy and were well several years later Dr C P LAPAGE said that he had had good results with potato cream in the treatment of infantile scurvy Dr REID again emphasized the difficulties of estimating accurately the bleeding and coagulation times and described a method he had employed with success he also referred to a case of familial telangiectasis under his care

---

The Belgian Society of Gynaecology and Obstetrics which administers the funds of the International Foundation of Gynaecology offers a prize of 10 000 francs for the best work published during the last four years in one of the official languages of the International Congress of Gynaecology Further information can be obtained from Dr Max Cheval Rue Alphone Hottat 16, Brussels

that the industry was carried on under conditions of maximum safety Captain Crookshank said that before the Government could produce proposals to deal with the greater matters relating to the mining industry they must await the report of the Royal Commission He has issued fresh instructions to inspectors and was considering drafting regulations to deal with the use of telephones and bells the question of fire precautions and of coal dusting He hoped that those regulations would be put into effect shortly He accepted the motion

The motion was agreed to

THE FACTORIES BILL

The second reading of the Factories Bill a summary of which appeared in these columns on February 13 (p 367) was moved in the House of Commons on February 11 by Sir JOHN SIMON Sir John said that questions of health were contained in Parts I III and IV of the Bill and these would be dealt with by Sir Kingsley Wood since they concerned the better health of the community in the widest sense

Mr CLYNES said the Bill proposed a large number of small changes but avoided the great issue of factory reform It omitted to provide a proper yearly rest for the average worker by *means of holidays* Lady ASTOR said the question should have been co ordinated with education and health Children were to be allowed to go into factories at 16 and to work a forty eight hour week with overtime working in many weeks up to nine hours a day Under 16 there was no over time but from 16 to 18 there would be Accidents occurred when young persons began to be tired and the hours for these should be limited to forty a week The Government must raise the age of entry of children in factories to 15 and the time was ripe for this She protested against the classi fication of women and young persons together and saw no reasons why women of a certain age and strength should not work overtime

Mr MANDER said the provisions to restrict the hours of work of women and young persons were an advance but why were not men brought in as well? Long hours affected men just as they affected women The present permitted hours of sixty per week were being worked in a number of cases at the present time particularly in the Midlands Mr BROOKE thought the Bill would do more than either the Board of Education or the Ministry of Health to keep the nation fit In the textile industry to day thousands of women and young persons worked a sixty hour week and ten and a half hours a day and the last two reports of the Chief Inspector of Factories showed that scandalously long hours were worked in some of the less efficient light industries There was too much overtime at this moment in the West Riding of Yorkshire

Mr BUCHANAN considered that a weakness in the present system was that the factory inspector had to carry out prose cutions The time of the inspector was taken up with pre sentation of cases when he ought to be inspecting The Bill should be changed so that prosecution of these cases should be undertaken by the Crown A forty eight hour week was not much advance on the pre war fifty four hour week in districts where people had been moved under slum clearance schemes and sent to suburbs four or six miles away

Mr BANFIELD appealed for the abolition of night baking Sir JOHN SIMON said he had already appointed a departmental committee under the auspices of the Home Office to go into this matter of night baking again and if the case was as overwhelming as Mr Banfield believed the report would pre sumably be in his favour Lord Alness had consented to be chairman and the committee had been asked to give its conclusions in time for them to be acted upon if necessary before the Factory Bill passed

MORE INSPECTION OF FACTORIES

Mrs TATE said the nation spent some £12 500 000 on health services for children in schools and that money must be wasted if their health deteriorated because they went to the factories too early or had to work under rigorous conditions At present there were 254 inspectors and 250 000 factories or one inspector for a thousand factories Under the Bill a much larger number of small factories would have to be inspected and it was imperative that the number of inspectors *should be sufficient* Of points in the Bill which needed to be safeguarded when the Bill was in committee she had noticed one enjoining the provision in every factory of a supply of drinking water That would be no use unless some form of sterilized vessel was provided from which to drink the water Every factory with 150 workers or over was to have a first aid outfit but she hoped that there would be somebody in the factory who understood first aid

Mr ELLIS SMITH said he had gone through a trade union report and was surprised at the extent to which workers suffered from hernia and ruptures It was common for five or six men to have to lift an object from one part of the factory to another He hoped the Bill would enforce the use of mechanical appliances for lifting extraordinarily heavy weights He had seen girls between 16 and 30 having to carry on for eight and a half hours a day afraid to leave their machines because of the economic effect on them if they did leave their work The Home Secretary should see that a provision was included in the Bill to allow women and girls in factories to have rest and attention if necessary He did not see in the Bill anything regarding the risk of lead poison ing in the decorative tile side of the pottery industry—risks mentioned in the annual report of the Chief Inspector of Factories and Workshops for 1935

Mr SHORT said that if factory inspectors could state their opinions freely they would express anger at the cautious manner in which the Bill approached matters concerning the health welfare safety and hours of labour of women and young persons Since 1918 the House had just tinkered with the problem and the Bill was stamped on every page with the word compromise The House ought to be legislating for a forty hour week He was disappointed that the Bill did not provide for expectant mothers *The Public Health Act 1936* provided that women should not have to work for four weeks after childbirth A period of six weeks before and six weeks after had been adopted in France Germany Russia Chile and possibly in other countries

The debate was adjourned

HEALTH PROVISIONS OF THE BILL

When the debate was resumed on February 15 Sir KINGSLEY WOOD commended the Bill to the House because many of its provisions embodied that advance in national health policy which was occupying attention to day *While it was right to* continue efforts to cure illness and physical defects more he said should be done to prevent them Many people looked forward to the time when doctors would be paid when people were well and fined when they were ill There was no doubt that incapacitating sickness and accidents in industry were still heavy and that much of that was avoidable Public Enemy No 1 was colds and influenza which accounted for about 25 per cent of absences from work The medical pro fession had not yet found an instant remedy for colds and influenza Some of the best safeguards against disease and illness especially of a minor character were in addition to shorter hours and longer holidays good housing airy schools good food *clean streets and open spaces*

Their efforts however could not stop short outside the factory door *and much could be done in promoting* the health of the working population by more medical supervision and more welfare provisions The need of further statutory pro vision for the lighting of factories was clearly established for *conditions* in many places were far from satisfactory Clause 5 of the Bill provided that there should be suitable and proper lighting in every factory and in every part of the factory The Home Secretary would have power to define by Order what was adequate and suitable illumination for factories or processes and certain minimum standards would be laid down

MEDICAL SUPERVISION IN SPECIAL TRADES

Under Clause 11 there was an important development towards assisting preventive medicine Under the existing Act

ENGLAND AND WALES

Maternity and Child Welfare

The seventh English-speaking Conference on Maternity and Child Welfare, of which Queen Mary is Patron, will be held in the Great Hall of British Medical Association House, Tavistock Square, W.C., on June 1, 2 and 3, under the presidency of the Minister of Health Sir Kingsley Wood The conference has been organized on behalf of the National Council for Maternity and Child Welfare and certain of its constituent bodies by the National Association for the Prevention of Infant Mortality, in co-operation with the Maternity and Child Welfare Group of the Society of Medical Officers of Health which will also hold a clinical course for medical practitioners on May 30 and 31 The subject for discussion throughout the conference will be "The Further Evolution of the Maternity and Child Welfare Movement throughout the British Empire and in the United States of America and the following aspects, among others will be included provision for the care of mothers and children the future of preventive psychology in relation to maternity and child welfare work nutritional problems in relation to mother and child the education of parents in the care of their children the chief health problems facing the administration of maternity and child welfare work—how they have to be overcome or what attempts are being made to overcome them, the training of health workers the special problems of rural areas, and of orphans, refugees, and destitute children The conference is open to all who are interested in maternity and child welfare, the fees for full membership, including the receipt of printed matter, are £1 1s per member, or in the case of two or of three members representing the same local authority or voluntary organization 15s and 14s each respectively Application for tickets, with remittance, should be sent to Miss Halford National Association for the Prevention of Infant Mortality 117, Piccadilly, W.1

It has been proposed to hold a maternity and child welfare exhibition at Woburn House opposite B.M.A. House, and that as part of this exhibition there should be a section devoted to historic exhibits in connexion with maternity and child welfare It is hoped that members of the medical profession might be able and willing to lend such things as early types of feeding bottles, cradles charms or other articles illustrative of the upbringing of little children in early Victorian times or earlier Any exhibit lent would be fully insured and every care taken while in possession of the committee Offers of exhibits may be sent to Miss Halford at the above address before the end of April

Air-raid Precautions in London

A report was presented to the London County Council at its meeting on February 23 on the steps which have been taken to co-operate with the Government in the formulation of a scheme of air-raid precautions Two officers of the Fire Brigade were trained at the Government civilian anti-gas school in Gloucestershire, and receiving certificates as first-class instructors, have trained twenty-four other officers as instructors and these are engaged in training the rest of the personnel of the Brigade About half the 2,000 officers and men requiring training have been instructed The question of first-aid posts for the immediate reception of casualties and of casualty clearing stations and base hospitals is being dealt with centrally by the Government for the metropolitan police district The medical officer of health has supplied particulars to the Home Office of the bed accommodation and ambulance facilities which the Council has available, draft proposals have also been prepared for the utilization of some of the mental hospitals The Government has not yet decided however, how to deal with the problem of base hospital accommodation for London casualties and further action by the Council must await its decision Courses of instruction have been arranged by the Home Office at certain of the Council's institutions for the medical staff of the public health and mental hospitals to become acquainted with the measures to be taken to secure protection against gas and to decontaminate personnel and material The medical staff thus trained will pass on their instruction to the nursing staff Measures are also being devised on a volunteer basis to deal with the decontamination of the parks from the effect of gases, and, by the chief engineer for the protection of the Council's pumping stations and other vital parts of the main drainage system After mentioning other measures such as the possibility of using sports pavilions as first-aid posts and the establishments of first-aid and decontamination rooms at County Hall, a reference is made in the report to the criticism directed by certain scientists and others against the effectiveness of the measures in which the Government has invited the Council to co-operate but it is pointed out that the responsibility for the effectiveness or otherwise of the proposed precautions must necessarily rest not with the Council but with the State and that the Council's duty in the matter is fulfilled by giving as it has given, the co-operation sought by the Government

SCOTLAND

Dundee Mental Hospital

Dr W Tuach Mackenzie physician-superintendent of Dundee Mental Hospital has intimated his resignation from this post, which he has held since 1903 Dr Mackenzie graduated M.B. Ch.B. at Aberdeen University in 1898, taking the M.D. degree in 1903 After holding resident posts he specialized in mental diseases, and was appointed first deputy medical superintendent and later physician-superintendent of Dundee Mental Hospital and lecturer on mental diseases at University College, Dundee

Health and School Clinics in Glasgow

Speaking at the annual meeting of the Glasgow Infant Health Visitors Association Dr A S M Macgregor, medical officer of health for Glasgow, referred to the valuable work which was being done by public health clinics recently established by the corporation The Town Council proposed to extend this scheme by building several new clinics in various parts of the city A recently opened one at Provan had started dental treatment for expectant mothers and this had proved a great success At the Cowcaddens clinic the experiment had been tried of conducting classes in mothercraft for schoolgirls, who had shown great keenness in the subject this work carried on at an impressionable age would undoubtedly produce good results in future The infant mortality rate of 109 per 1,000 last year in Glasgow had been disappointing and had been largely due to a widespread and prolonged epidemic of measles in the city

The benefits that have accrued to the physical condition of Glasgow school children are emphasized by Dr G Arbuckle Brown, senior deputy medical officer of health for Glasgow in the annual report of the education health service This report deals with the year to July, 1936, and records that the average weights of the children in each of the six main age groups and the average heights in most of the groups were the highest recorded for sixteen years There was a further fall in the incidence of rickets, and low percentages in the number of children notified to their parents as needing medical attention or

there was power to require medical examinations as a permanent arrangement in codes of regulations for dangerous trades, but it would be of great value to employers and workers that arrangements for medical supervision could be made from time to time in particular works and in certain circumstances He had in mind cases where there might be an outbreak of dermatitis where irritating substances were being used where there had been an introduction of new chemicals likely to be injurious to the workers, or where an outbreak of anthrax was suspected In such cases the Home Secretary could issue special regulations requiring reasonable arrangements to be made for medical supervision of the health of the people so employed This would be a useful provision for protecting the health of the workers and for reducing short time The Home Secretary would also be able to make special arrangements requiring reasonable medical supervision of young persons who were employed on work that might carry risk of injury to their health

Some of the welfare provisions in Clause 8 should also have an important bearing on the general health of the workers There was to be suitable accommodation for workers clothing with arrangements for drying wet clothes He also attached importance to the facilities laid down for the seating of women in preventing excessive fatigue and ill-health Another clause made an important modification of the law with regard to the prevention of injurious affections of the lungs The new provisions required workers to be protected not only against the breathing of dust or fumes of an injurious or offensive character as under the present law, but against the breathing of any kind of dust to a substantial extent

EMPLOYMENT OF WOMEN DURING PREGNANCY

The suggestion that the Bill should prohibit the employment of women in factories during the last six or eight weeks of pregnancy raised a matter of great difficulty and complexity The British Medical Association had put forward certain views on the matter, but the Association's memorandum said that there seemed no valid reason why a pregnant woman should not perform some work of a suitable nature up to the last week or two of pregnancy, and that it would be a hardship if cessation of factory work were to be made compulsory One of the difficulties was that if it were to be made a penal offence for a woman to be employed in a factory for a stated period before confinement it would be quite impracticable to penalize the employer, and the penalty would have to be imposed on the woman herself. Then there arose the question of who was to determine the period of pregnancy A good many women would resent a compulsory prohibition of the kind suggested, and it must be asked whether such a prohibition might not have a bad effect by discouraging a woman from availing herself of ante-natal services at an early stage of pregnancy

The Bill also proposed by amendment of the law and by administrative action to improve the medical arrangements for the examination of young persons by the certifying surgeon The certifying surgeon would in future be required to give a positive certificate that the young person was fit for employment and not merely a negative certificate that he was not unfit Steps were also being taken to ensure a greater measure of co-ordination of the various State health services The Bill made the important provision that education authorities should supply the school medical history to the certifying surgeon By that means the surgeon would have before him the whole medical history of the person being examined On behalf of the local authorities he (Sir Kingsley Wood) could say that they were anxious to co-operate in the efficient enforcement of the provisions entrusted to them by the Bill The Bill would mean a great betterment in the health and conditions of many millions of industrial workers

MEDICAL VIEWS

Sir FRANCIS FREMANTLE said that people working in modern factories were in a better state of health than they were under some of the deplorable housing conditions which the Government was doing so much to improve He hoped that the Government's measures for physical recreation would be considered as a complement to this Bill, the more leisure the workers had and the more they enjoyed it the better There was some medical opinion however, which showed that for some occupations and for some persons it was not a bad thing to work a good deal more than the actual hours laid down in the Bill Long hours of employment were not necessarily bad It had also been found that some workers enjoyed the monotony of their work, since it required less concentration Sir Kingsley Wood had referred to the necessity for providing for ventilation as well as for the temperature of the factories, but he had forgotten to mention a third factor—namely, humidity The thermometer told very little as to whether or not the atmosphere was agreeable unless two other factors were taken into account—the movement of the air and the humidity of the air It largely depended on the heat regulating power of the body whether one was able to breathe at the optimum required for one's work The katathermometer which registered the temperature the moisture, and the movement of the air was not used in our factory system An advance had been made in the appointment by the Home Office of certifying factory surgeons responsible to it and having nothing to do with the educational authorities or the sanitary authorities Under this Bill the description was changed, and the certifying factory surgeon was called an examining surgeon We needed a system where there was a medical officer whose job whether part-time or whole time would be to study the health conditions all the way through the factory, and, when he felt it necessary, to make suggestions concerning an individual the conditions of the factory, or the processes, so far as they affected health It had been said that there was difficulty in employing local medical officers in these conditions, the employers objecting to the local officials going into the factories because of secret processes which they had to guard from their competitors That was a difficulty which ought to be overcome Properly appointed and trained officials would never be guilty of revealing secrets of any kind There ought to be much closer connexion between the factory medical officers of the Home Office and the local medical officers of the health and the educational authorities than was aspired to in this Bill

NEED FOR TRAINING IN INDUSTRIAL MEDICINE

It was certainly an advantage that under the Bill a dossier from the schools was to be passed on to the examining surgeon, who would examine the children going into industry, for obviously the health history of a child during school life was of great importance when he or she went into a factory It was, however, not the same thing as he had suggested The medical officer who had been examining the child during the whole of his or her school life was the most qualified if he understood the conditions of the factory, to decide whether the child was fitted to go into that factory and under what sort of working conditions a certificate should be issued He regarded the Bill as only a temporary measure while they were thinking out a way in which they could improve the general liaison of the health services Industrial medicine had become a matter of vital importance to industry and to the health of the nation and must be under medical officers who were specially trained In factories at the present time the medical men had not been trained in industrial medicine Hitherto it had been entirely left out of the general education of the medical man In the special post-graduate services dealing with public health it was left out because the public health services did not deal with industrial medicine There was growing up a generation of medical men who were studying this question, but he was afraid that the ordinary medical men in the country were not being properly trained for what he believed would be the duties which would be cast on them in future in connexion with the health of the nation

NOTIFIABLE DISEASES OMISSION OF CANCER

Sir ERNEST GRAHAM-LITTLE urged that a larger measure of medical supervision should be provided under the Bill He did not think that there was any medical reason why they

as having to be excluded from school on account of some disease The medical officers during the year made 2,900 visits and examined 54,882 children in the ordinary schools and 1,903 in the schools for children who are physically and mentally defective In addition, 14,965 children were examined at the request of teachers on account of some suspected defect, and 27,005 were re examined as having been found abnormal The numbers of children treated at the school clinics showed an increase of 12 per cent over those of the previous year, this increase being due however, to improved arrangements for examination rather than to any increase in diseases or defects The total number seen and treated at the clinics was 79,843, and the defects included diseases of the ear 4 399, diseases of the eye, 4,324, diseases of the skin 17,569, defective vision, 11,282, defective teeth 26 020, operations on tonsils, 1,435, deformities for remedial treatment, 1,621, other minor diseases, 12,646 The housing conditions of school children were investigated, and it was found that the number of inmates in one-apartment houses had diminished from 5 1 in 1924 to 4 9 in 1936, although the average number of inmates was still excessive in the smaller houses of one or two apartments Comparison of the figures for height and weight of children showed that these bore a direct relation to the sizes of the houses occupied by the families, and that there were increases this year in the average measurements for children in each size of house, the improvement being most marked at the ages of 9 and 13 years

IRELAND

Gift to Belfast Hospitals

Various Belfast hospitals and charities are to benefit to the extent of £100,000 through the munificence of Sir George E Clark and his brother, Captain H Douglas Clark The gift has been made in memory of their parents, and will be an additional stimulus to the further development of the selected institutions The late Sir George Clark was one of the founders of the famous shipbuilding firm of Workman and Clark, which, with Harland and Wolff, enjoyed a great reputation among British shipbuilders for the high class liners and vessels they produced Outstanding among the numerous gifts is £15,000 to the paying patients block of the Royal Victoria Hospital, and a similar sum to the Belfast Hospital for Sick Children for the building and equipping of a paying patients department for children of all classes £5,000 has been given to the Pathological Institute of the Royal Victoria Hospital and to the Mater Infirmorum Hospital Among other recipients are the Benn Eye and Ear Hospital and the Ulster Hospital for Women and Children

Irish Free State Medical Research Council

The first meeting of the Medical Research Council of Saorstat Eireann was held on February 16, when the following members were present Professor R P Farman (chairman), Professors J W Bigger, J F Donegan W J E Jessop, H Moore, T G Moorhead, and J M O Connor, and Dr J McGrath The thanks of the Council were accorded to the Executive Council of Saorstat Eireann for facilitating the formation of the Council and for putting at its disposal an annual grant, to the Hospitals Commission for advice and assistance, to the Royal Academy of Medicine in Ireland, under the auspices of which the preliminary work was done, and to the directors of Hospitals Trust Ltd, who placed at the disposal of the Preliminary Committee their staff and premises and who bore all the expenses in connexion with the incorporation of the Council The following officers were appointed hon treasurers, Dr McGrath and Professor O Connor, hon secretary, Professor Bigger, solicitor, Mr P H O Reilly

Correspondence

Mental Disorder and the Endocrines

SIR—The relation between mental disorder and the activities of the endocrine glands, so ably presented by the openers, was the subject of discussion at a meeting of the combined Sections of Psychiatry and Medicine at the Royal Society of Medicine on February 9 (*Journal* February 20, p 404), but it related chiefly to the gonads The subject is no new text, for Sir George Savage in 1890 described cases of hypothyroidism in association with mental diseases, as did Kocher in 1883, Ord in 1880 Gull in 1873, and Schiff as far back as 1859 Victor Horsley referred to the influence of the thyroid as a necessary hormone in the physiology of metabolism and Halliburton referred to a nucleo albumin filling up the normal thyroid —and containing iodine—which exercised a profound influence on the body

The general symptoms following removal of the thyroid were fully described by Horsley who referred to myxoedema in adults and sporadic cretinism in the young both characterized by slow clumsy movements of the heavy body with its overgrowth of connective tissue and the thin and coarse hair and also mental apathy listlessness inactivity and depression —all of these symptoms improving after the administration of the gland Cases of this type are not infrequent in asylums (now mental hospitals) and my notes refer to nine marked cases which improved so much that they were discharged from Claybury One was readmitted owing to privation and inability to purchase the thyroid but she was again discharged recovered One suffering for twenty years from diabetes (as a complication) could not take the thyroid owing to faintness and it had to be discontinued There are other notes which need not be detailed

'I should like to refer to the pituitary, one of the mysteries of the human body, insomuch as 8 grains should be able to exercise such an enormous influence on the tissues of the body, especially the bony structures I think one of the first cases in an asylum was in Colney Hatch, the institution now so ably presided over by Dr John Brander

This was the case of a middle aged woman admitted in 1884 with the unmistakable symptoms of acromegaly She was under my care at the time and was suffering from delusions of persecution abnormal sensitiveness irritability headache, and vague lumbar pains There was general enlargement of the bones of the limbs (the hands and feet) and of the bony skeleton and the face was characteristic Her sight was not affected, and there were no symptoms of subthalamic pressure She lived for several years but the case was so unusual that I invited several of the then staff of St Bartholomew's Hospital to see her but no diagnosis was reached After her death a post mortem examination was conducted by my successor Dr Cecil Beadles afterwards one of the curators of the Royal College of Surgeons He found a much enlarged sella turcica and a tumour of the pituitary, and he believed it was the first recorded in this country Shortly afterwards Marie named the disease acromegaly and I sorrowfully record that I missed attaining immortality and an imperishable name!'

The case of Dr Leonard Mark described by himself, is well known and to day the literature of the subject is extensive, especially in regard to cases of hypopituitarism and Frohlich's syndrome or hyperpituitarism and gigantism No one has a wider knowledge of the pathology of the ductless glands than Sir Arthur Keith and he may have among his notes the case I refer to—I am etc,

London S W 1 Feb 20 ROBERT ARMSTRONG JONES

should differentiate between men and women in the Bill he would like the division simply to be between adults and adolescents the latter of course requiring some age qualification Special measures might be called for on account of age but not of sex with the one exception of pregnancy Pregnancy ought to be regarded as in the nature of an illness and treated according to the individual case There ought to be no hard and fast rule such as four weeks rest before and after delivery but individual patients should be treated according to their circumstances They ought to legislate with some attention to basic facts He pleaded for much better medical service in factories The Chief Inspector of Factories made a very impressive statement in 1932 when he said that they had come to the limit of usefulness in devising gadgets to prevent accidents and that more consideration should be given to the human factor That was borne out by statistics One could predict that a certain group of persons would have accidents It was the same in cases of idiosyncrasy Out of the total number of disabilities which caused absence from work in factories practically one half were due to external irritants and disease of the skin

Clause 62 of the Bill dealt with notifiable industrial diseases The five diseases declared notifiable were lead poisoning phosphorus poisoning mercurial poisoning arsenical poisoning and anthrax Why those diseases were singled out he did not know The figures for lead poisoning were much larger than the others For three years the figure was 535 cases of lead poisoning with 123 deaths In the case of phosphorus poisoning its inclusion seemed specially curious for the last recorded cases were in 1910 That was very easily explained In 1908 the Phosphorus Poisoning Act was passed and it immediately stopped accidents from that cause As regarded mercurial poisoning the total number of cases in the last three years was only two and there were no deaths while in the case of arsenical poisoning there were five cases and no deaths The most important section was that of anthrax which was decreasing very rapidly The number of cases of anthrax in the last three years was sixty and the mortality was ten By far the most important industrial accident or disease was cancer, which was on the increase all the time It was not notifiable In the last three years there were 535 cases and 123 deaths The cases of cancer referred to in certain reports arose from two causes—oil and tar Oil of course was the lubricant used in the cotton industry and it was the cause of an extraordinary large mortality In the last report of the Registrar General the figure for the mortality from cancer produced by oil was 4 per 1 000 000 of the ordinary population but among cotton spinners it was 134 per 1 000 000 It had been ascertained that the production of the disease by oil depended upon the nature of the oil—the heavier the oil the more cancer it produced and experiments which had been tried in Manchester chiefly showed that these oils could be identified and that it was possible to determine beforehand what would happen if a certain oil was used A formula was now available which could be very easily applied and by which it was possible to determine before a particular oil was used what was likely to result from its use in the matter of cancer production and the injury to the skin caused thereby Although that information had been quoted in the medical press for the last three or four years he saw no mention of it in any of the factory inspectors reports This information had been passed on to the body which dealt chiefly with petroleum manufacture Tar was another important cause of cancer It was very largely used in the manufacture of patent fuel and the mortality among tar workers was high The incidence of cancer caused by tar was 4 per 1 000 000 of the general population but in the case of tar workers it was 695 per 1 000 000 and in the case of chimney sweeps who were subject to somewhat similar conditions it was 534 per 1 000 000 A statement in the report of the Chief Inspector of Factories for 1935 showed what could be done by really efficient medical supervision The Inspector said that the cost for compensation in the group with periodical medical examination amounted to £1 390 whereas in the other group the cost was £1 624 so that there was a clear annual saving as a result of periodical medical examination The opportunity afforded by this Bill to increase the amount of medical supervision should not be lost Medical supervision should be provided for all workers irrespective of age or sex

GOVERNMENT REPLY

Mr GEOFFREY LLOYD replying to the debate said that the provision in the Bill in regard to medical supervision gave an important new power It enabled the Home Secretary in several circumstances to see that there was undertaken proper medical supervision on certain processes Fortunately they had one or two examples where medical supervision had taken place not compulsorily but voluntarily A few years ago there were developments in some of the factories making accumulators for motor cars which led to an increase in lead poisoning They had a considerable number of cases—over 100 in one year—and being progressive the firms approached the Home Office which arranged that there should be medical supervision in these works A young doctor was put in charge of the work and went into it very scientifically Immediately there was the slightest indication of lead in the body the man was either taken off the work in which lead was used or a radical alteration was made in the processes from the point of view of the elimination of lead Owing to the measures that were taken the cases of lead poisoning dropped rapidly and during the last three or four years there had been in one factory only one or two cases at most and in the others none

The Bill was read a second time without a division

Scottish Maternity Services Bill

Consideration of the Maternity Services (Scotland) Bill by a Standing Committee of the House of Commons was completed on February 16 The committee then resumed its discussion of the new clause proposed by Mr Graham Kerr which deals with facilities for instruction in midwifery Mr GRAHAM KERR said the object of the clause was to ensure that the existing method of training students would be maintained and if possible improved Mr WESTWOOD said the proposed clause would provide living experiments for those who had just entered on their studies as medical men or as midwives and would extend facilities to any persons undergoing training though this might be the first day of training Mr T M COOPER said he did not think the new clause was an appropriate measure for ensuring continuity in the supply of skilled doctors and midwives The clause literally read would involve an intolerable invasion of the liberties of private people and would require the local authority to secure that adequate facilities for domiciliary instruction were made available to any person engaged in training That was too wide Mr G A MORRISON said hospital instruction itself was not adequate He had figures which showed that 68 per cent of the births in maternity hospitals were abnormal and it was not advisable to study the normal from the abnormal Mr ELLIOT hoped that Mr Kerr would withdraw the clause

Mr Kerr did not feel prepared to do this and the clause was negatived without a division

PANEL OF DOCTORS PRACTISING MIDWIFERY

Mr MATHERS then moved a new clause as follows

> It shall be lawful for a local authority to appoint a number of registered medical practitioners to form a panel for the purposes of Section 22 of the Midwives (Scotland) Act 1915 and when such panel is so formed the medical practitioner called to her assistance by a midwife provided by a local authority under Subsection (1) of Section 1 of this Act shall be selected from the panel so formed

In proposing that the clause be read a second time Mr Mathers said his object was to ensure that a midwife who found herself faced with some difficulty or abnormality should be able to call in not merely a medical practitioner but one who was skilled in midwifery A statement provided by Glasgow Corporation showed that in Glasgow during 1935 out of 544 medical practitioners whose practice included service under the National Health Insurance Acts 144 did no midwifery 166 attended from one to five cases 82 attended from six to ten cases 86 attended from eleven to twenty cases and 66 attended over twenty cases during the year

When is Abortion Lawful?

SIR,—Referring to a letter and a leading article in your issue of February 20 (pp 393 and 418), I think that there can be no doubt that abortion, which, as the law stands, is undoubtedly criminal, has for many years been largely practised, and is probably now commoner than before

It is true that great discretion is used in instituting prosecutions It is extremely difficult to convict even the most notorious abortionists, who are, for the most part, not medically qualified Some forty years ago I interviewed the Director of Public Prosecutions of that time in regard to advertisements which were then common, and which were obviously for methods of criminal abortion by drugs, etc He told me of an enterprising policeman who laid a trap for a well known abortionist and was himself badly caught He took his own wife, who was pregnant, and asked him to procure abortion for her The abortionist got his blow in first by charging the man with inciting him to commit a felony The policeman had a bad time

A notorious medical abortionist saw his patients once only He used instrumental means to terminate the pregnancy, and told the patient to go home and call in her own doctor He warned her that she must tell her doctor nothing about the operation One such patient called in her doctor He gave her every care but she died and instrumental injury was detected As the patient had observed complete silence her doctor was in a most dangerous position, as there was no evidence that anyone else but he could have used the instrument He had never heard of the abortionist and knew nothing of him

Doctors are from time to time asked to procure abortion for patients, and refuse to do so Not infrequently they are sent for at a later date to deal with unavoidable miscarriage The patient in some cases proceeds to tell the doctor, in the presence of a nurse, how she succeeded in bringing about the miscarriage which he has to complete The doctor, of course, maintains professional secrecy It certainly looks, however, as though he might be regarded as *particeps criminis* with a patient guilty of criminal abortion—I am, etc,

Lingfield, Feb 21 HUGH WOODS M D

SIR,—Your leading article "When is Abortion Lawful?" in last week's *Journal* is not quite complete in its legal aspect In 1929 an Act of Parliament was passed entitled 'An Act to Amend the Law with regard to the Destruction of Children at or before Birth" This Act was passed to remedy a curious defect in English law, to which attention was called by Mr Justice Talbot during the trial of a case before him He pointed out that whilst it was criminal to destroy a child by procuring abortion or to kill it directly after birth (infanticide) it was no offence to cause the death of a child during the actual process of birth The essentials of the 1929 Act are as follows

Any person who with intent to destroy the life of a child capable of being born alive, by any wilful act causes a child to die before it has an existence independent of its mother shall be guilty of felony and shall be liable to penal servitude for life No person shall be found guilty unless it is proved that the act which caused the death of the child was not done in good faith for the purpose only of preserving the life of the mother Evidence that a woman has at any material time been pregnant for a period of twenty-eight weeks or more shall be prima facie proof that she was at that time pregnant of a child capable of being born alive

It is quite clear that the operation of procuring abortion is now legal under certain circumstances—namely, that it is done to save the life of the mother, and that the seventh month of pregnancy has been reached This still leaves the main question of the legality of therapeutic abortion for preserving the health or life of the mother during the first seven months or for preserving the health of the mother after seven months in the same uncertain condition as it was before the passing of the Act The law having made abortion legal under certain circumstances, it may well be argued that it is illegal under any other circumstances

In my book on *Criminal Abortion* (Bale Sons and Danielsson, 1932) I cited at pages 22 to 24 a case which bears directly on the matter discussed in your leader Although this occurred in France, it might just as readily have happened in our own country It cannot be too strongly emphasized that no doctor ought under any circumstances to procure abortion on a patient unless he has obtained agreement of a colleague of repute to the performance of the operation—I am, etc,

Specific Antitoxins for Gonococcal and Meningococcal Infections

SIR,—In the *Journal* of February 13 Dr T Anwyl Davies described the specific antitoxin treatment of gonorrhoea May I draw attention to a method of treating chronic gonorrhoea in women which effects an active immunization of the body and which was introduced fifteen years ago By this method the body itself is called upon to produce the necessary antitoxins, which in chronic gonorrhoea are no longer produced by the tissues

As a gynaecologist I have only studied chronic gonorrhoea in women Live gonococci are injected intracutaneously in certain predetermined quantities In contrast to the high temperatures frequently caused by the antitoxin employed by Dr Anwyl-Davies, the injection of live gonococcal cultures hardly produces a fever Usually only one single injection is required to heal chronic gonorrhoea The inoculation is perfectly harmless, and there is no danger of a gonococcal sepsis being caused by the injection because the live gonococci are killed very quickly in the skin Hitherto some 3,000 injections of this kind have been performed at the gynaecological and dermatological clinics in Berlin, Kiel, Konigsberg, Wiesbaden, etc Results have shown that about 60 to 70 per cent of cases of chronic gonorrhoea in women can be cured by this method This percentage is hardly reached with the antitoxin employed by Dr Anwyl-Davies At the Surgical University Clinic, Berlin, Professor Bier applied this method to a number of cases of acute gonococcal arthritis Within twenty-four hours after the intracutaneous injection of the gonococcal cultures the patients were free from pain and able to move the affected joint The cure of chronic gonorrhoea in women by way of intracutaneous injections of live cultures was only assumed when a negative finding of gonococci was maintained for one year after the treatment at least As far as I know this treatment, according to the method outlined above, was commenced last year at St Mary's Hospital—I am, etc,

London, W 1, Feb 21 ALFRED A LOESER

*** With reference to Dr M H Gordon's letter on this subject in last week's *Journal* (p 414) our annotator writes I have the greatest respect for Dr Mervyn Gordon's achievements in connexion with the serum treatment of meningococcal meningitis, a field of work in which he has had a wider and more fruitful experience than any man living I omitted reference to his work in discussing Dr Anwyl-Davies's paper only because the two subjects seemed to me only remotely connected The

It would not be possible in country districts to have medical practitioners devoting their time to special aspects of work, and the clause, therefore, was made optional In Glasgow in 1935 medical help was called for by midwives in 33 per cent of the births occurring in that year In 1934 the percentage was 32 and in 1933 it was 31 That proved the need for providing that the midwife should be able to call to her aid at the earliest moment one who could bring the proper skill to bear on the case

Mr ELLIOT said the proposed new clause could not be complete unless penal provisions were incorporated, and against whom would fine and imprisonment be proposed? Would it be against the midwife who summoned the doctor or against the doctor who attended? To suggest that a local authority should decide who should not carry out the practice of midwifery under the Bill would give a power never yet given to any local authority He sympathized with the object of the clause but, after all, the midwife was well acquainted with those who practised midwifery in the area where she worked Mr WESTWOOD and Mr STEPHEN suggested a voluntary panel of practitioners specially skilled in midwifery Mr ELLIOT said there would not be difficulty in compiling a list of those who were practising midwifery The local medical practitioners would be better able to give this information than anybody else, and such a list could be available to the midwife Before the report stage he would consider whether such a provision could be incorporated in the statute

Mr MATHERS then withdrew the proposed new clause

The committee approved the schedules of the Bill and consideration on the report was completed, the Bill thereafter being reported to the House

Unemployed Men at Papworth

Matters relating to Papworth Tuberculosis Sanatorium and Papworth Village Settlement were raised in the House of Commons on February 17 on the motion for the adjournment by Mr ROWSON He said disquieting information concerning Papworth had come into his possession, and he had received unsatisfactory answers on the subject from the Minister of Labour and the Minister of Health A case had been brought to his notice where a young man who had suffered from tuberculosis for a long time, and was known to be in a fairly acute stage, was asked to prepare himself to go to work in the printing shop, but collapsed and died within fifty minutes An alternative story was that this man was on his way to see the doctor, but Mr Rowson was convinced that he had died on the way to work He died from a pulmonary aneurysm It ought to be possible for medical men who continually supervised tuberculous cases to find out the stage in the disease when a thing like that might happen Mr Rowson recalled that he had already put questions to the Minister of Labour and the Minister of Health about men being sent to Papworth to be employed in the workshops side by side with the victims of tuberculosis All medical men with whom he had come in contact said there was a possibility of infection from merely breathing the same atmosphere as a tuberculous patient He could not appreciate the position which the Minister of Health had taken up, and the practice of sending non-tuberculous workers to Papworth should be ended as soon as possible Mr Rowson said he had lately visited Papworth, and found men there from the distressed areas who told him they had not been warned of the kind of place in which they were to be employed and that they dared not leave on their own account, because if they went away there would be no unemployment benefit for them In the place where these men were working there were other non tuberculous men, and also patients suffering from tuberculosis in various stages

Captain BRISCOE said that men employed at Papworth asked him to let it be known that the vast majority of workmen there were more than satisfied with their conditions

Mr ERNEST BROWN quoted a letter from Sir Kingsley Wood, who stated as a result of careful inquiry that it was not the fact that persons suffering severely from tuberculosis were employed until a few days before death save in the exceptional case of a patient, otherwise fit, dying from rupture of a pulmonary aneurysm, which could not be foreseen Mr Brown added that the man mentioned by Mr Rowson died on the way to a medical inspection, and that the only work given him to occupy his mind was moving a small lever with one finger Papworth was so valued by those who suffered from tuberculosis that the settlement was full Since August thirty-eight trainees from four different centres had come voluntarily to Papworth, and of these fourteen had left All fourteen left the institution without any harm whatever, and only one was disallowed benefit Besides twenty four trainees now working there, eighty eight ordinary workmen were engaged under similar conditions, who had no fear and received no harm

The discussion then concluded

In a reply to Mr Sexton on February 18, Sir KINGSLEY WOOD said Papworth Village Settlement including the sanatorium hospital, was registered as a war charity under the War Charities Act, 1916 In a further reply to Mr Rowson on the same date Sir Kingsley said he had approved the sanatorium hospital at Papworth as an institution for the treatment of tuberculous patients sent by local authorities It was inspected from time to time by his officers, and was to that extent under the supervision of the Ministry of Health but not under that Department's control

Inquests on Infants Doctors' Fees

Sir KINGSLEY WOOD told Sir Arnold Wilson on February 17 that his attention had not been called to the refusal of certain coroners to pay the usual fees to doctors in respect of statements made to the police as to the cause of death of infants The Ministry had not advised doctors in such circumstances to refuse to make statements Sir ARNOLD asked whether, having regard to the suffering involved to the persons immediately concerned and to the importance of avoiding unnecessary inquests, Sir Kingsley would endeavour to secure uniformity in the practice of coroners in this matter by introducing legislation if necessary Sir KINGSLEY, in reply suggested that Sir Arnold should supply him with particulars of any cases of hardship which he had in mind

Sale of Methylated Spirits in Scotland

The House of Commons, on February 17, gave Miss FLORENCE HORSBURGH leave to bring in a Bill to control the sale in Scotland of methylated spirits and of methylated spirits in admixture and for purposes connected therewith She said the evil effects of the drinking of methylated spirits in Scotland were well known The Bill was based on an enactment by the Parliament of Northern Ireland which had proved satisfactory Retailers of methylated spirits had to obtain a yearly Customs and Excise licence The Bill proposed to attach to the granting of a licence further conditions, such as registration of the applicants with the local authority, the keeping of a record of sales, and the selling only on receipt of an order signed by the purchaser stating the purchaser's address and the purpose for which the spirits were required The measure had the approval of a large section of public opinion in Scotland

The Bill was read a first time and its text was subsequently issued

Cambridge Scientists' Anti-War Group

On February 22 Mr PARKER asked the Home Secretary if he would make an investigation into the observations of the Cambridge scientists as the result of their examination of recommendations put forward by the Air Raids Precautions Department of the Home Office and if he would publish the full scientific evidence on which the proposals for the gas-proofing of rooms in private houses had been based

Mr GEOFFREY LLOYD said he presumed Mr Parker referred to the Cambridge Scientists' Anti-War Group This group must not be confused with the general body of Cambridge scientists The Government was advised in regard to these matters by the most distinguished scientific experts not only from Cambridge but from Oxford and other universities The observations of the Cambridge Scientists' Anti War Group had been carefully investigated, with the result that both the experiments themselves and the deductions made from them

whole literature of meningococcus and gonococcus 'antitoxin' claims that they are something totally distinct in nature from any anti bacterial serum, and indeed they are prepared and tested by methods quite different from those advocated by Dr Gordon His suggestion that filtrates of gonococcus culture really contain endotoxin is explicitly denied by Ferry himself, who states in his original paper (*J Immunol* 1931, **21**, 233) that lysed cocci do not produce the skin reaction by which the presence of his "exotoxin is deduced and recognized It will be seen that there are wide divergencies here in belief as well as in method In my opinion the whole of Ferry's work stands in need of confirmation and elucidation With Dr Gordon's plea for authoritative intervention in matters of this kind I am in whole hearted agreement It is supremely unsatisfactory that the production of therapeutic serum in this country should be undertaken only for profit commercial considerations, though admittedly an incentive to research and improvement can also act in more than one way prejudicial to the advance of knowledge It is perhaps not generally understood that all but very few of the leading bacteriologists in this country are excluded from participation in serotherapeutic research by the fact that the largest animal at their command is the rabbit The State Serum Institute which has brought international fame to Denmark could surely be emulated here, if only for research purposes rather than supply It would then be possible for independent research workers, unfettered by the obligations of a commercial laboratory, to attack the fundamentals of such a problem as this

Mandelic Acid in Urinary Infections

SIR,—In the interesting and helpful annotation in the *Journal* of February 20 (p 396) in which you write

> the real problem is the chronic case which though rapidly responding to treatment, relapses (often with an acute attack) within a few days or weeks Repeated courses of treatment only result in as many relapses

a misunderstanding is possible and your final remarks might lead physicians, without knowledge of this treatment to give it up It was emphasized in some of the original papers that treatment after cessation of the acute symptoms, should be carried on for many months far from forty-eight to seventy two hours every week, and my experience of many cases is that if this procedure is adhered to there are no relapses Patients do not care to have to go on taking the medicine and adhering to the restricted fluid diet for forty eight hours every week in some cases for the rest of their lives but I have had no difficulty in persuading them to do so, as, where the symptoms have been real, they are very grateful for the continuous relief from what is a very dreadful affliction —I am, etc,

Hypochromic Anaemias and Iron Deficiency

SIR,—In the interesting paper by Dr J F Brock which appeared in the *Journal* of February 13 (p 314) the author refers on several occasions to my published work on the iron deficiency anaemias, and draws certain deductions therefrom

Dr Brock bases his conclusion that 9 grains of ferrous sulphate is an insufficient dose of iron on the statement that only ten out of twenty one cases treated by me responded satisfactorily to this dose by a rise in the haemoglobin level of 1 per cent daily Reference to my paper (*Edin med J* 1934 **41**, 99) clearly indicates that only eleven out of the twenty one cases can be utilized for such an assessment—namely, Cases 1 to 11 The others, for reasons stated, must be excluded either because the dose was less than 9 grains of ferrous sulphate daily, or because of coexisting complicating factors, such as cancer, nephritis, and haemorrhage during treatment Of these eleven cases ten showed an increase in the haemoglobin level of 1 per cent or more daily, while in the eleventh case the haemoglobin rose by 0 86 per cent daily, a figure which would be considered satisfactory by many authorities In the experience of Professor Davidson and myself, comprising hundreds of cases of hypochromic anaemia, 9 grains of ferrous sulphate daily has been found to be a satisfactory dose in the great majority of cases

I should like also to draw attention to a misquotation of the figure calculated by me for the iron loss during lactation My figure for this loss during six months lactation was 180 mg (*British Medical Journal* 1936, **2**, 523), not 750 mg, as quoted by Dr Brock in the table on page 315 of his article—I am etc,

Cancer of the Breast

SIR,—In 1924 I read in Mr Duncan C L Fitzwilliams's book on the breast the following sentences

> that cancer can grow out in a ring for a distance of six eight or more inches all round the growth—Handley gives distances of nineteen, twenty and even twenty two inches—to a subcutaneous nodule and that the intermediate spread all disappears and leaves no trace is in my opinion not only incredible but absurd'

and—

> I can only conclude by saying that after giving very careful attention to all the writings and arguments on this subject I have not met a single fact which would support the argument in favour of permeation as everything can be explained by the far simpler method of blood borne or lymphatic emboli

I realized then that I could not count Mr Fitzwilliams among my supporters That impression is strengthened by his recent letter (*Journal*, February 20 p 416) But I have not hitherto replied to his criticisms because I had already published in full the facts and observations which drove me to the conclusions he finds so absurd (*Cancer of the Breast* 1922 second edition Murray) I also might have considered them absurd before I had studied the subject at first hand Mr Fitzwilliams still apparently has not done so He is a clinician not a histologist and microscopical evidence appears to mean little to him, or so I infer from the fact that his book on breast cancer contains many clinical illustrations but only four microscopical ones all borrowed

He has studied the subject of dissemination in the forensic manner of a lawyer getting up a case Barristers and judges avoid any first hand observation and rely upon the verbal statements of witnesses Mr Fitzwilliams has given careful attention to all the writings and arguments on dissemination, and as the advocate for embolic spread he presents his case with considerable skill in the form of a series of assertions ignoring all the troublesome facts which confront him The unshakeable rock upon which the permeation theory rests is the detection of the "microscopic growing edge of permeated lymphatics at considerable distances from the primary growth—for example in the deltoid region of the arm or midway between the umbilicus and the ensiform cartilage

had been proved to be open to grave criticism It would not be in the public interest to disclose details of the experiments on which the Government's plans were based but those experiments were conducted with actual war gases liberated under practical conditions and the precautions proposed would be effective in affording a very great measure of protection

National Health Insurance Regulations—Sir KINGSLEY WOOD told the House of Commons on February 17 that the coming into operation on January 1 1937 of the National Health Insurance Act 1936 necessitated the revision of all regulations and orders made under the Acts previously in force Good progress had been made with this work and as soon as it was complete the preparation of a new edition of the Statutes Regulations and Orders relating to national health insurance would be put in hand

Waiting Period for Health Insurance Benefit—Mr ERNEST BROWN informed the House of Commons on February 23 that the Government accepted a recommendation from the Unemployment Insurance Statutory Committee that the waiting period for the receipt of benefit should be reduced from six to three days and that there should be a relaxation of the conditions under which more than 156 days of benefit may be drawn in the benefit year A resolution would be tabled to make the reduction in the waiting period effective from April 1

Medical News

The Royal Society of Medicine is giving a reception on May 10 next, at 8.30 p.m., in order to celebrate Coronation Week It is the desire of the council to entertain on this occasion medical men from the British Empire from over seas, whether Fellows of the Royal Society of Medicine or not who will be in London for the Coronation As accommodation is limited it would be of assistance if medical men wishing to avail themselves of the society's hospitality on this occasion would communicate with the secretary, 1, Wimpole Street, W.1, not later than May 1

A course of lectures on 'Digestion and Indigestion will be delivered by Dr Edward Mellanby F.R.S., secretary of the Medical Research Council before the Royal Institution 21 Albemarle Street, W., on Tuesdays, March 2, 9 16 and 23 at 5.15 p.m.

A Chadwick Public Lecture on "Legal Aspects of Sanitary Science Public Health Acts 1875–1936" will be delivered by Mr W. T. Creswell K.C. in Gray's Inn Hall, Holborn W.C., on Tuesday, March 9, at 8.15 p.m.

The annual clinical meeting of Guy's Hospital Dental School will be held in the dental department on the morning and afternoon of Saturday March 6 when demonstrations of modern procedures will be given by members of the staff and cases of clinical interest shown to past students

The thirty eighth annual meeting of the Lebanon Hospital for Mental Diseases, Asfuriyeh near Beirut, Syria will take place in the Winter Garden of the Cora Hotel Upper Woburn Place W.C.1 on Tuesday, March 2 at 3 p.m. with the president, Dr R. Percy Smith, in the chair and Dr Nathan Raw as opening speaker

The third Conference of the Austrian Association for the Study of Diseases of the Throat, Nose and Ears will be held at Innsbruck on May 28 and 29 when various addresses followed by discussions, will be given The official report will be published in the *Monatsschrift fur Ohrenheilkunde und Laryngo Rhinologie* including the text of the addresses Notice of intention to participate should be received by the conference director, Schottenring 24 Vienna I. not later than April 15

During the week ended February 20 the number of deaths ascribed to influenza in the 122 great towns (including London) of England and Wales was 423, compared with 697 in the preceding week In London the number of deaths from influenza was thirty three against fifty in the preceding week and the notifications of pneumonia in London were eighty seven against ninety four

The twenty seventh Hospitals Nursing Midwifery and Public Health Exhibition and Conference will be held at the New Horticultural Hall, Westminster, S.W., on March 1 2, 3 4, and 5, and will be open from 11 a.m. to 7 p.m. daily (except the first day, opening 2.30 p.m., and the last day closing 6 p.m.) The sections of the exhibition include occupational therapy anti gas and air raid precautions, mothercraft, electricity, architecture and oxygen There will be conferences on nursing midwifery public health (under the presidency of Dr William C. Gunn) and medical gymnastics and receptions have been arranged for every day of the conference Members of the medical profession, municipal officers and health workers generally will be admitted to the exhibition on presentation of their visiting cards Particulars may be obtained from the honorary convener Colonel R. J. Blackham, C.B. C.M.G., 40, Holland Park, W.11

The 162nd anniversary dinner of the Medical Society of London will be held at Claridge's on Thursday, March 4 at 7.45 p.m., with the president Sir William Willcox in the chair

The German Society for Combating Rheumatism will hold a congress at Wiesbaden on Sunday March 14 Further information can be obtained from the general secretary, Dr Krone Potzdamer Platz 1, Berlin W.9
